

ICAO: UNITING AVIATION ON CLIMATE CHANGE

**ACT>>>  
GLOBAL**

**ICAO Colloquium on  
Aviation and Climate Change**

# **Adaptation and inter-agency co-ordination: a tourism perspective**

**Chris Lyle, Representative of the World  
Tourism Organization (UNWTO) to ICAO**

**Montréal, 13 May 2010**

A photograph of a snowy mountain slope. In the foreground, there's a mix of snow and brown ground. A red fence runs along the left side. In the middle ground, there's a small building or lift station. The background is a dense forest of tall evergreen trees under a clear blue sky.

# Adaptation

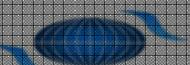

Climate change is NOT an abstract concept  
for tourism

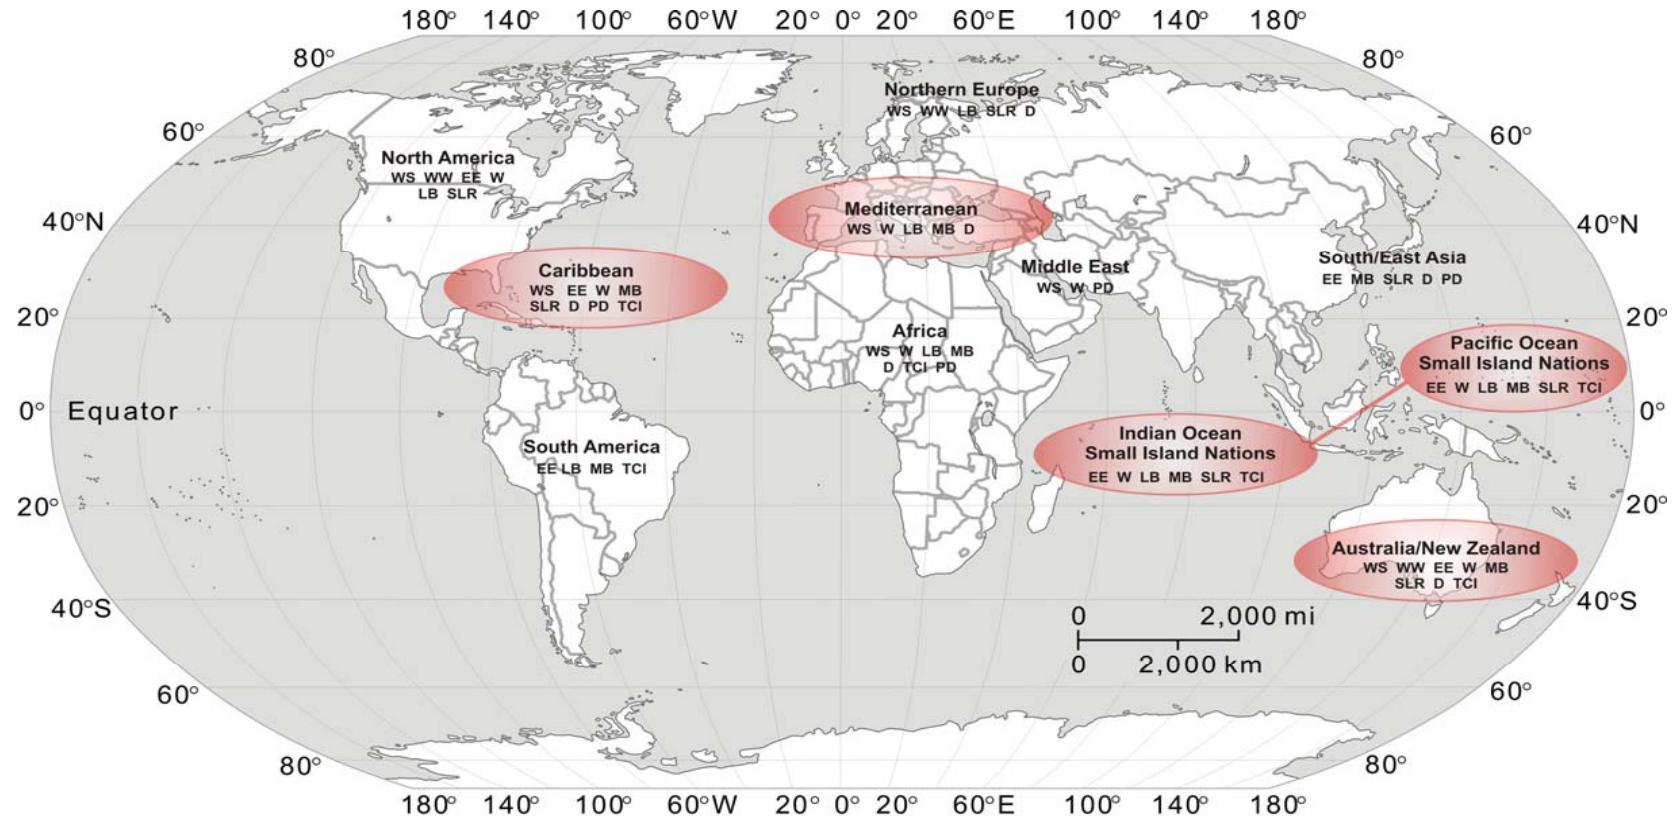

# Tourism and climate change adaptation

- Direct impacts (winter sports holidays, sun-and-sea destinations, infrastructural damage, higher operating expenses, etc)
- Indirect environmental change impacts (water availability, biodiversity loss, coastal erosion, etc)
- Impacts of mitigation policies on tourism mobility (changing travel patterns)
- Indirect societal change impacts (negative repercussions on climate change security hotspots)

Adaptation is ALREADY UNDERWAY

# Major climate change impacts affecting tourism destinations

WS = warmer summers

LB = land biodiversity loss

D = increase in disease outbreaks

WW = warmer winters

MB = marine biodiversity loss

TCI = travel cost increase from mitigation policy

EE = increase in extreme events

W = water scarcity

SLR = sea level rise

PD = political destabilization

Hotspot

ICAO Colloquium on Aviation and Climate Change

# Aviation and climate change adaptation

- Passenger mobility (changing travel patterns, cf tourism)
- Operational safety impacts (more frequent hostile weather, more intense weather systems, etc)
- Infrastructural impacts (low-lying airports, etc)

# Tourism and climate change

- Increasing intensity in requirements for adaptation is correlated with increasing potential for climate destabilization and hence with the need for mitigation
- Even the most aggressive mitigation efforts will not eliminate the need for substantial adaptation

Tourism is thus focused both on adaptation and on mitigation from a sectoral as well as a global perspective

# Tourism and climate change mitigation

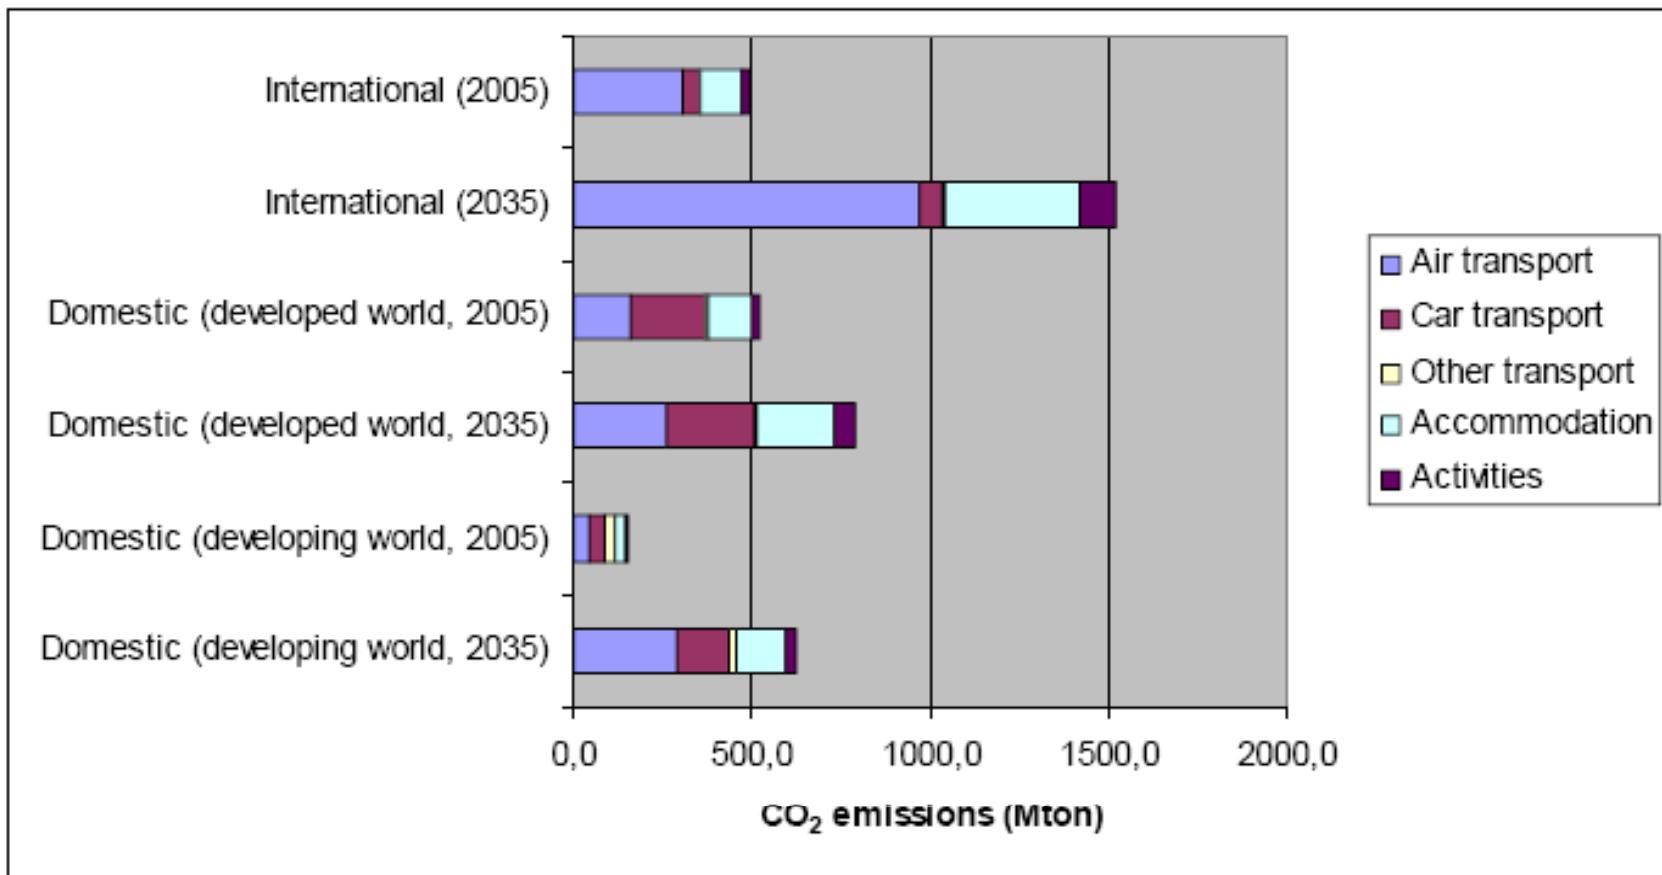

- GHG emissions from travel and tourism are estimated to contribute about 5% in terms of global CO<sub>2</sub> emissions (less in terms of the total GHG impact)
- Air transport accounts for an estimated 40% of the travel and tourism contribution of CO<sub>2</sub> (and over well over half of the total GHG impact)
- Air transport accounts for an estimated 60% of the **international** contribution of CO<sub>2</sub>, and is overwhelmingly dominant at medium- and long-haul

Source: UNWTO-UNEP-WMO, *Climate Change and Tourism: Responding to Global Challenges*, June 2008 (reconciled with IPCC reports)

# Projected travel and tourism CO<sub>2</sub> emissions ('business as usual')

# Tourism and climate change mitigation

- “While there are many options to reduce emissions [in the travel and tourism sector], by far the greatest potential is related to air travel; reducing flight numbers and flight distances will achieve more to make tourism more sustainable than most other measures taken together.”

*“Climate Change and Tourism: Responding to Global Challenges”, eCLAT, November 2007*

## Tourism and climate change: the Davos Declaration

“....the tourism sector....must.....

- .... progressively reduce its GHG contribution....
- ....collaborate in international strategies in transport (in co-operation with the International Civil Aviation Organization and other aviation organizations)....”

Adopted by the global *Conference on Climate Change and Tourism* in October 2007 and being pursued through the “Davos process”

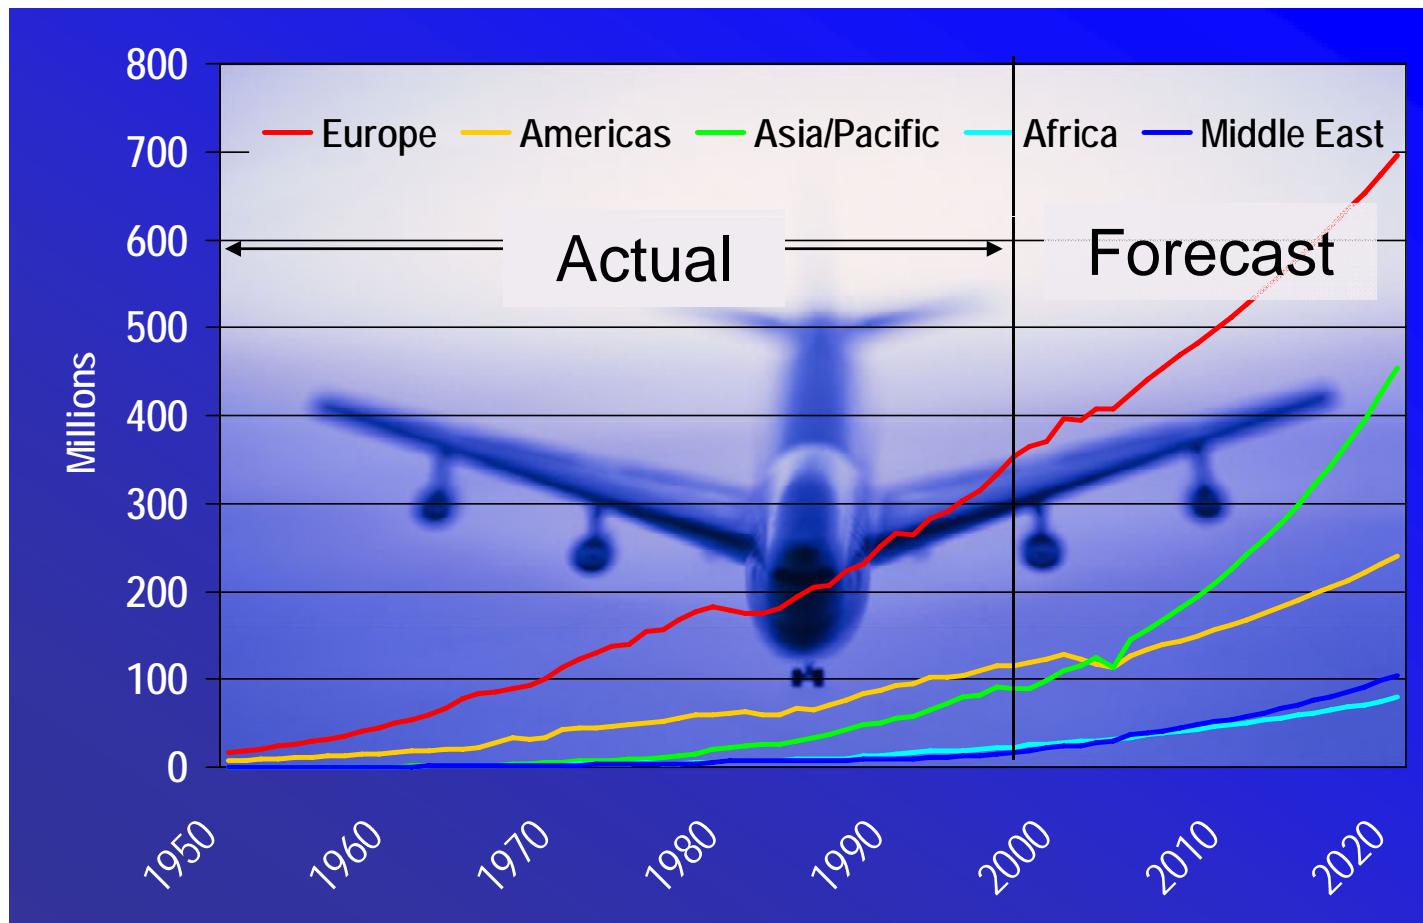

# Air transport and international tourism: Locked at the hip

- International air passengers are predominantly tourists (business and leisure travellers)
- Over half of international tourist arrivals are by air (increasing yearly, with much higher proportions for long-haul destinations)
- International tourism and air transport traffic and revenues tend to move in lockstep, with tourism being more resilient in times of uncertainty when tourists stay closer to home

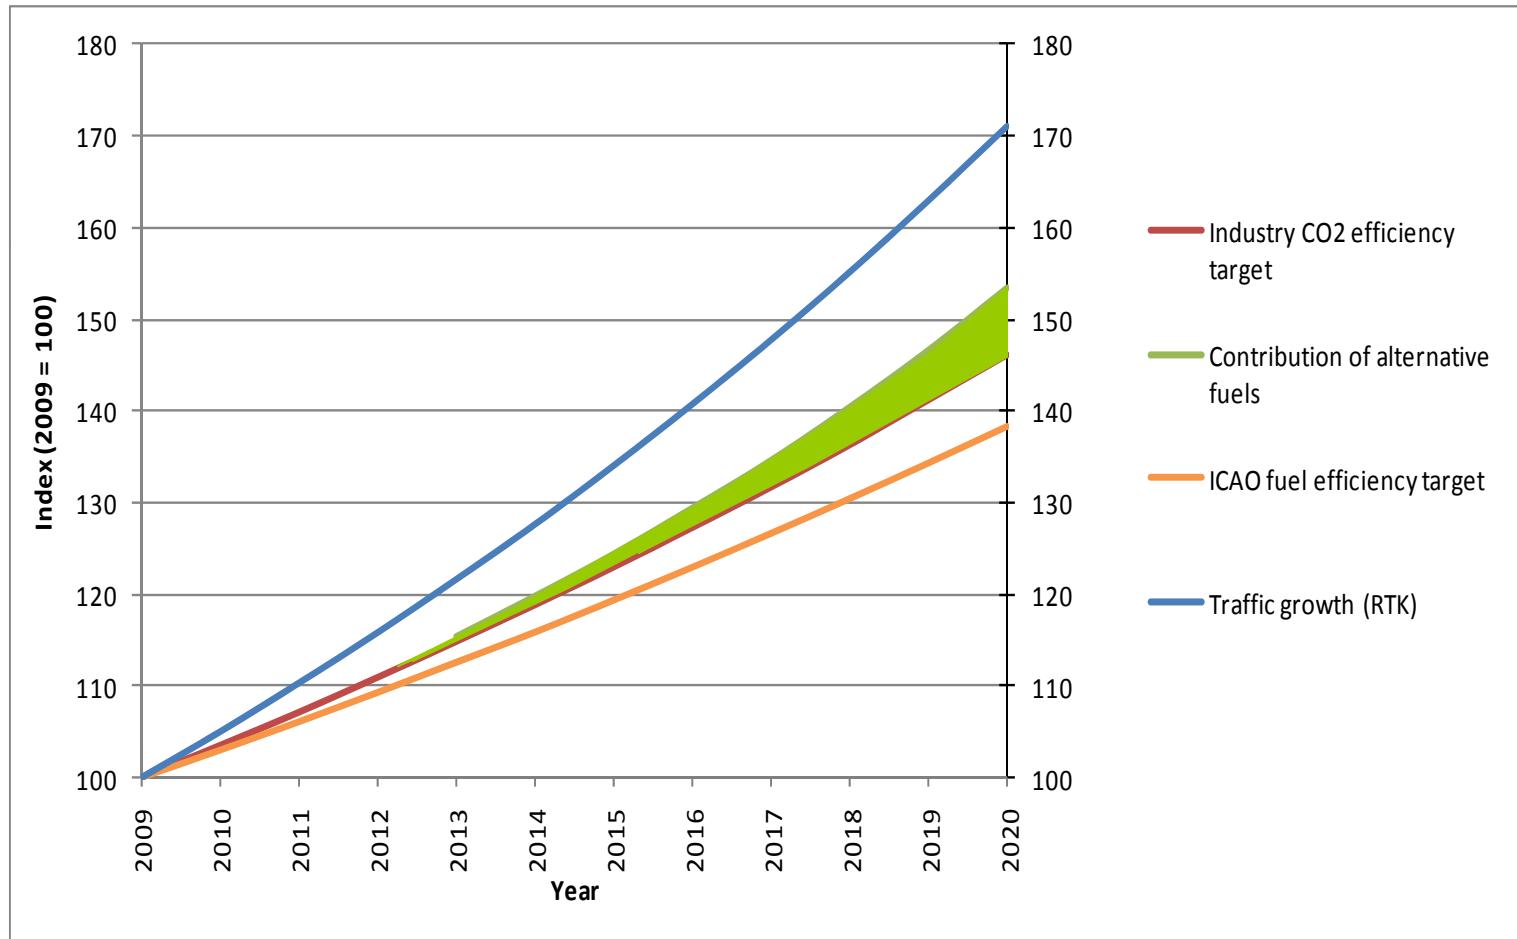

# International tourist arrivals, 1950 - 2020

# Global air transport traffic growth and emissions targets 2009-2020

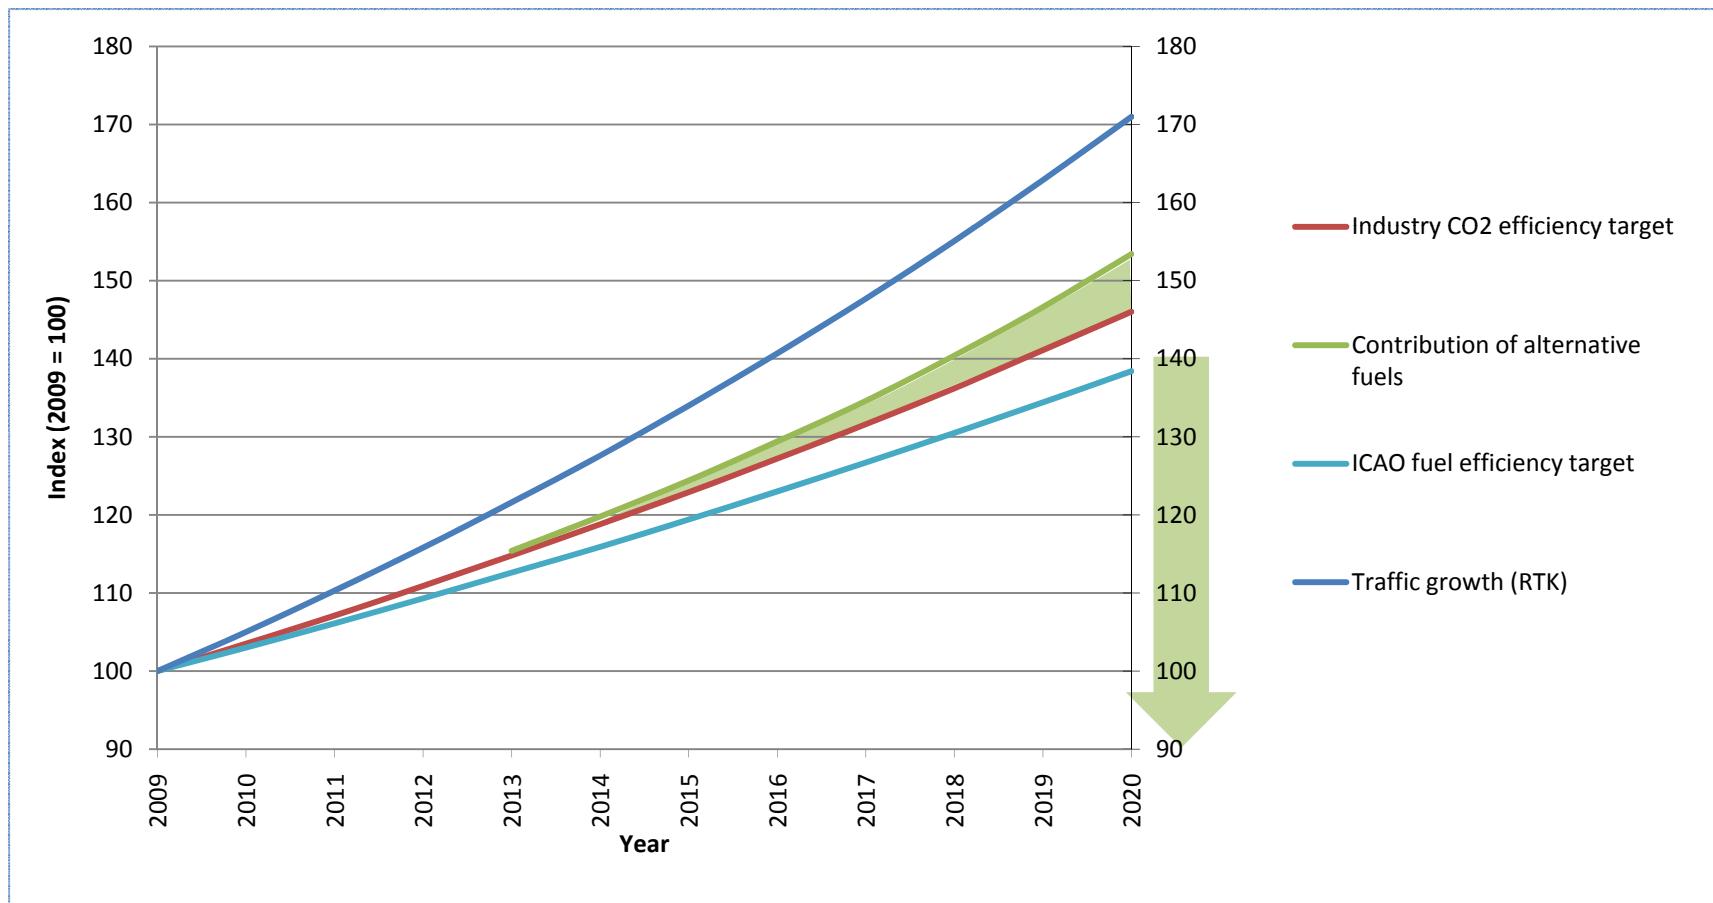

# Global air transport emissions

- Technological, operational and infrastructure enhancements continue to be substantial
- Developments in alternative jet fuels are promising
- But even together they fall well short for the foreseeable future of countering anticipated growth in air traffic

# Global air transport traffic growth and emissions targets 2009-2020

# Global air transport emissions

- Economic instruments will be necessary
- Such instruments have scope implications well beyond air transport and beyond national boundaries
- Emissions policy for aviation is likely to have considerable consequences for destinations depending on tourism and travel

GLOBAL

ICAO Colloquium on Aviation and Climate Change

## A paradox

- Tourism is the dominant economic sector, predominantly dependent on (long-haul) international air transport
- Tourism has enhanced establishment of nature parks and marine protection areas
- Partly in consequence, the country is a NET ABSORBER of GHGs

Air transport must be placed in context

Air transport is integral to tourism and should not be treated in isolation

# A tourism perspective on air transport and climate change (1)

- Assess mitigation measures against broad spectrum travel, tourism and trade, not for air transport in isolation
- Apply UNFCCC principle of CBDR
- Give preferential treatment to air services supporting the development of tourism in developing/small aviation market countries
- Take an even-handed approach to primary users (tourism and freight) and amongst modes of transport

# A tourism perspective on air transport and climate change (2)

- Earmarking/recycling of revenues from levies/trading of emissions permits to GHG mitigation activities
- Technology transfer and financing to poor countries
- Continued recognition of a key role for ICAO in technology, ATM, infrastructure and operations
- Open, collegial forum for economic instruments and any global accord specific to aviation and/or shipping, in context of the “DELIVERING AS ONE UNITED NATIONS” initiative

# Delivering as one

Under the UNFCCC umbrella:

- UN providers (ICAO and IMO)
- UN users (UNWTO and UNCTAD)
- UN scientists (IPCC, UNEP, WMO)
- World Bank
- Private sector and NGOs (ATAG/IATA, ICS, ICSA, WTTC, WEF, booz&co)
- Etc

From silos to synergy

# Thinking beyond the silos

- Carbon tax on accommodation to purchase carbon credits for aviation (truly “carbon neutral” destinations)?
- Carbon tax on jet fuel with proceeds to production and distribution of alternative aviation fuels?
- Hybrid closed/open emissions trading (an idea from the shipping industry)?
- Levy differentiation by route rather than solely by country (especially for LDCs and SIDS, consistent with both CBDR and Chicago)?
- Joint ICAO/IMO proposals to UNFCCC?

# What if air transport doesn't achieve?

Expect an un-coordinated patchwork of levies (some of unproven benefit), operating and capacity restrictions, even rationing, debilitating to both air transport and tourism
