

INTERNATIONAL CIVIL AVIATION ORGANIZATION

A United Nations Specialized Agency

INTERNATIONAL AVIATION AND ENVIRONMENT SEMINAR

Nairobi, Kenya 16 to 17 June 2014

Operational improvements and Environment Performance Based Navigation (PBN) Air Traffic Management (ATM)

**Seboeso M Machobane
RO ATM/SAR ESAF**

Discussion topics

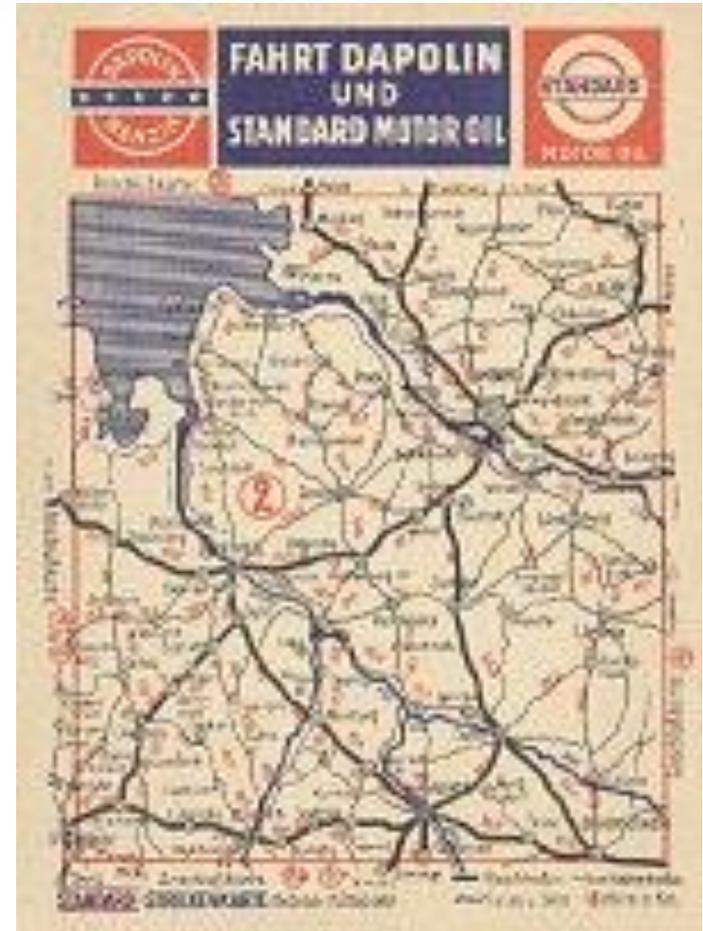

- Evolution of air navigation
- Global ATM vision
- Performance based navigation (PBN)
- Operational improvements
 - PBN routes
 - Continuous Climb and Descent Operations
 - Airspace Concepts

Evolution of air navigation

IN THE BEGINNING

- And Rivers
- And Railroads
- And Buildings
- And Telephone Lines
- And Whatever Else I Can See

Evolution of air navigation (Cont.)

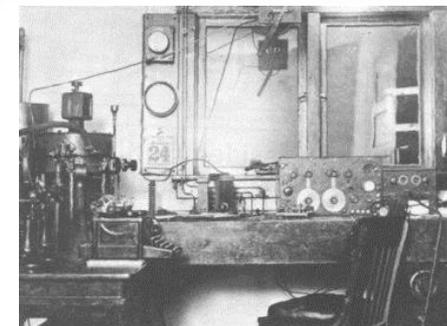

- 1910s
 - First Bonfires and Beacons
- Early 1920s
 - Lighted airport boundaries
 - Spot-lit windsocks
 - Rotating lighted beacons on towers
 - Lighted Airways

Introduction to PBN (Cont.)

RADIO

- Radio for Two-Way Communications
 - Weather Updates
 - Request Help With Navigation
- Radio for Navigation
 - Radio Marker Beacons
 - **4-Course Radio Range System**
- Pilots Listen for Navigation Signals

Evolution of air navigation

Navigation aids

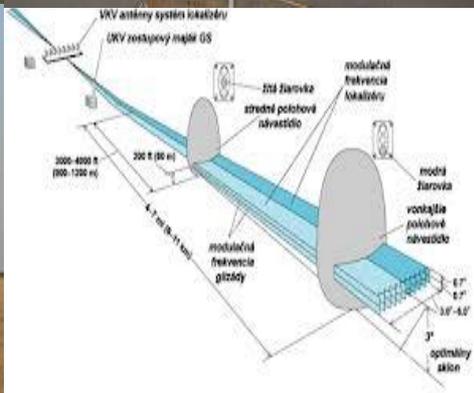

NDB

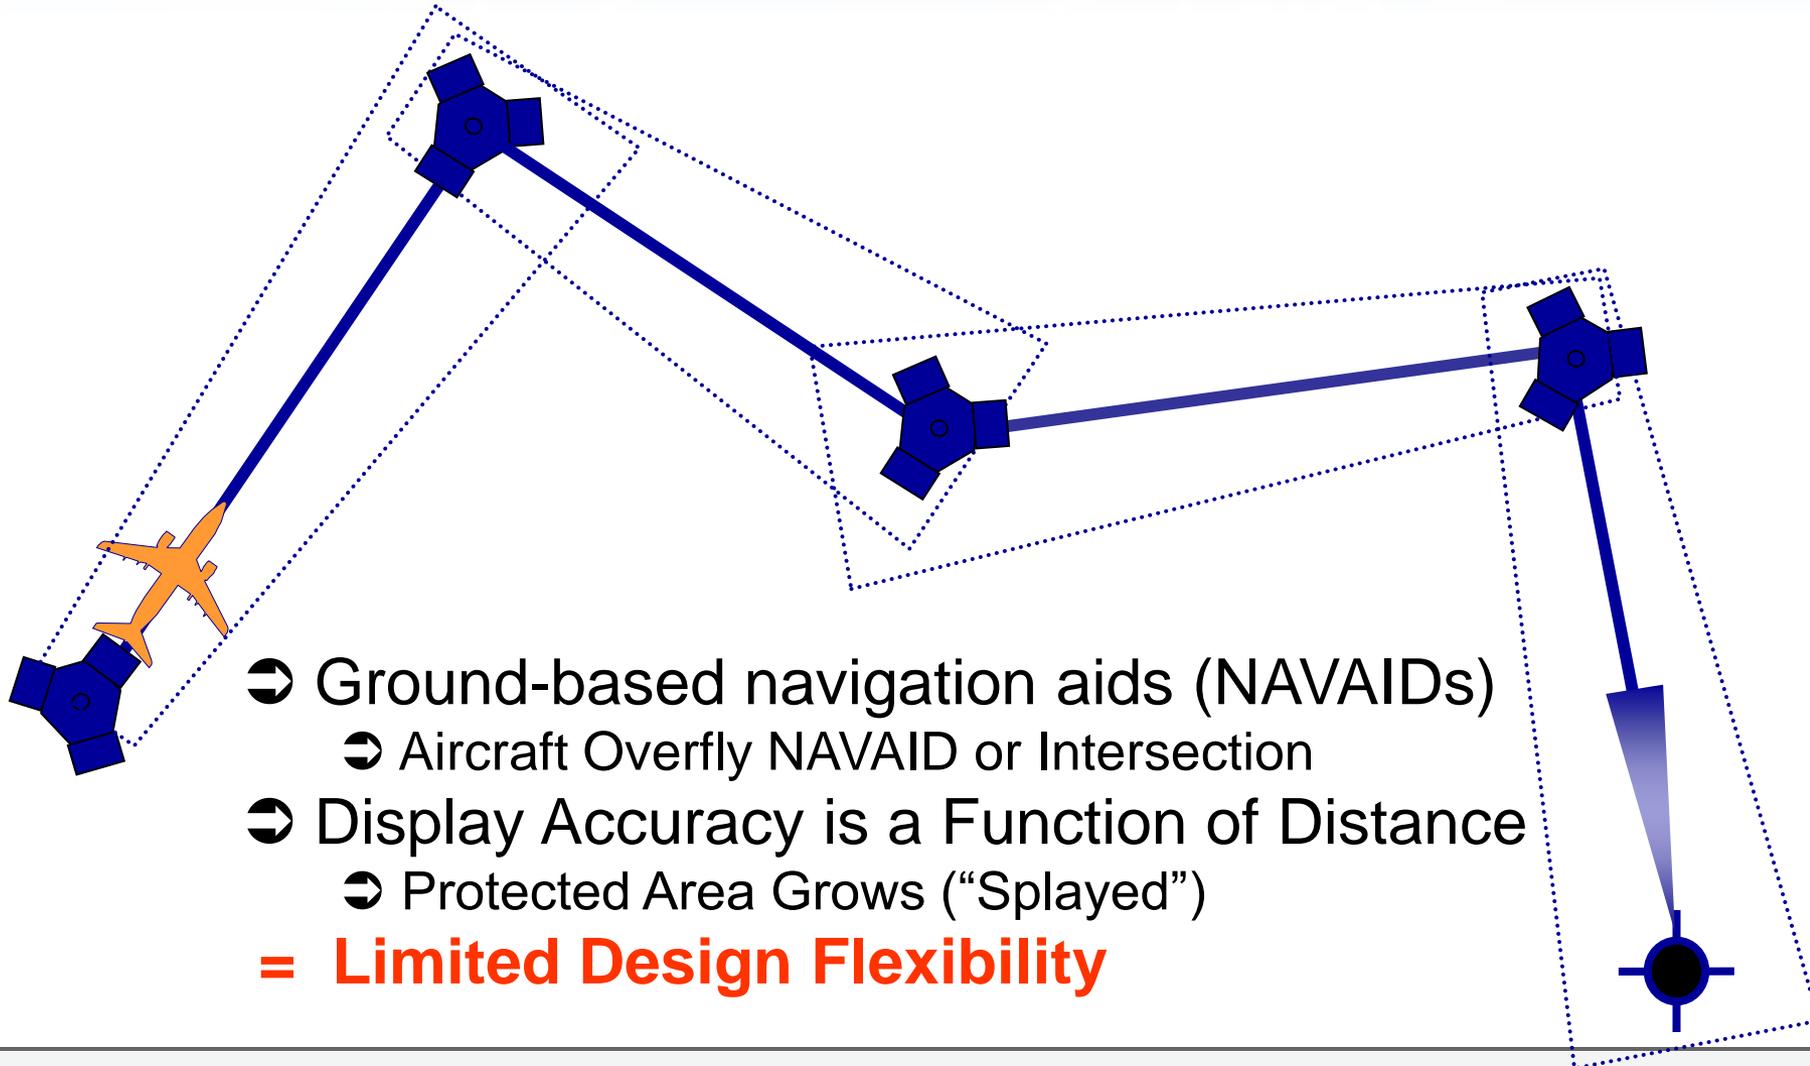

VOR

ILS

DME

Evolution of air navigation

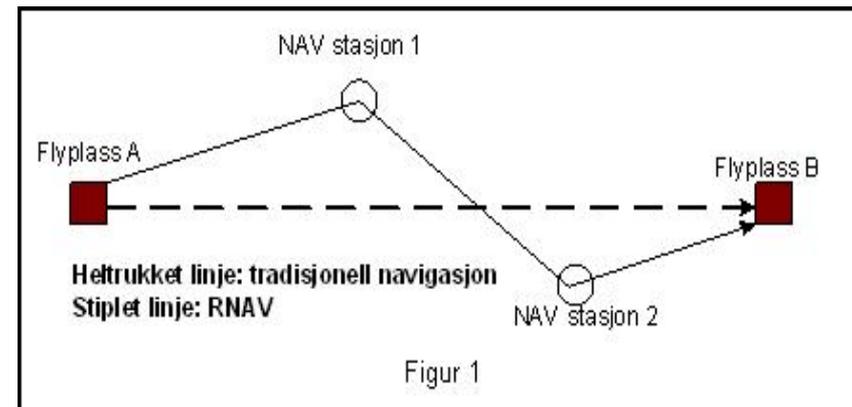

Evolution of air navigation

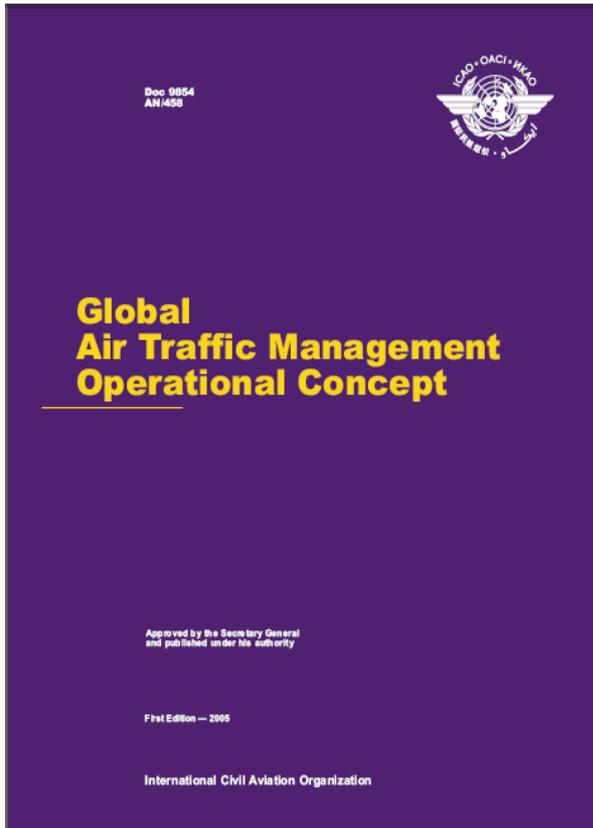

Area Navigation (RNAV)

- RNAV is a method of navigation enabling aircraft to fly on any desired flight path:
 - within the coverage of referenced NAVAIDS, or
 - within the limits of the capability of self-contained systems
- Developed in the 1960s
 - First routes published in the 1970s in the US
 - Uses VOR, DME (and later GPS) signals to generate trajectories which are not “VOR to VOR”
- RNP
- Developed in the 1990s
 - First RNP approach 1996

The ATM Operational Concept - Global ATM vision

To achieve an interoperable global air traffic management system for all users during all phases of flight, that

- meets agreed levels of safety;
- provides for optimum economic operations;
- **is environmentally sustainable**
- meets national security requirements.

Global ATM vision (Cont.)

Expectations of the ATM Community

- Access and Equity
- Capacity
- Cost-effectiveness
- Efficiency
- **Environment**
- Flexibility
- Global interoperability
- Participation by the ATM community
- Predictability
- Safety
- Security

Performance based navigation (PBN)

Enabler of the Vision & operational Improvements

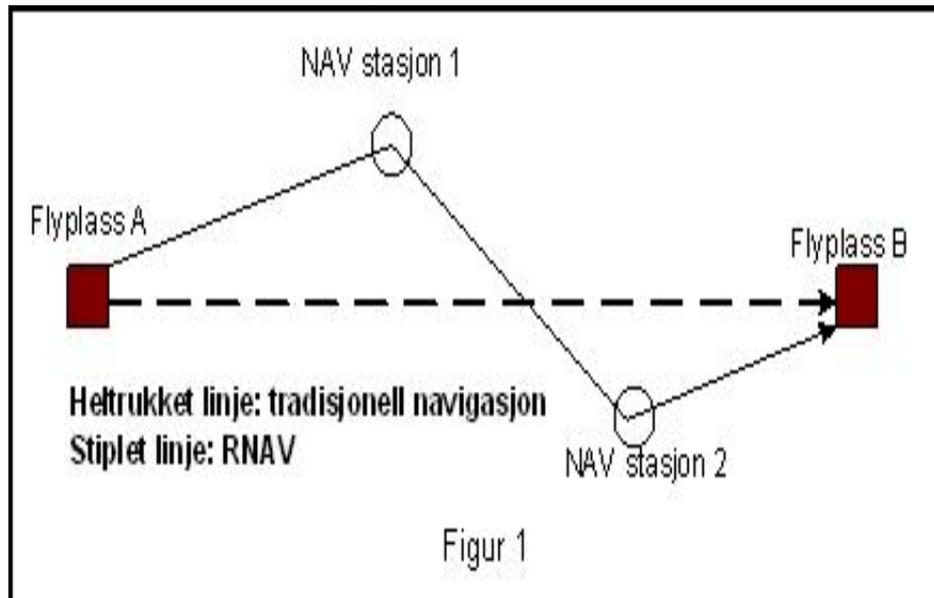

Assembly Resolutions - A36-23; A37-11

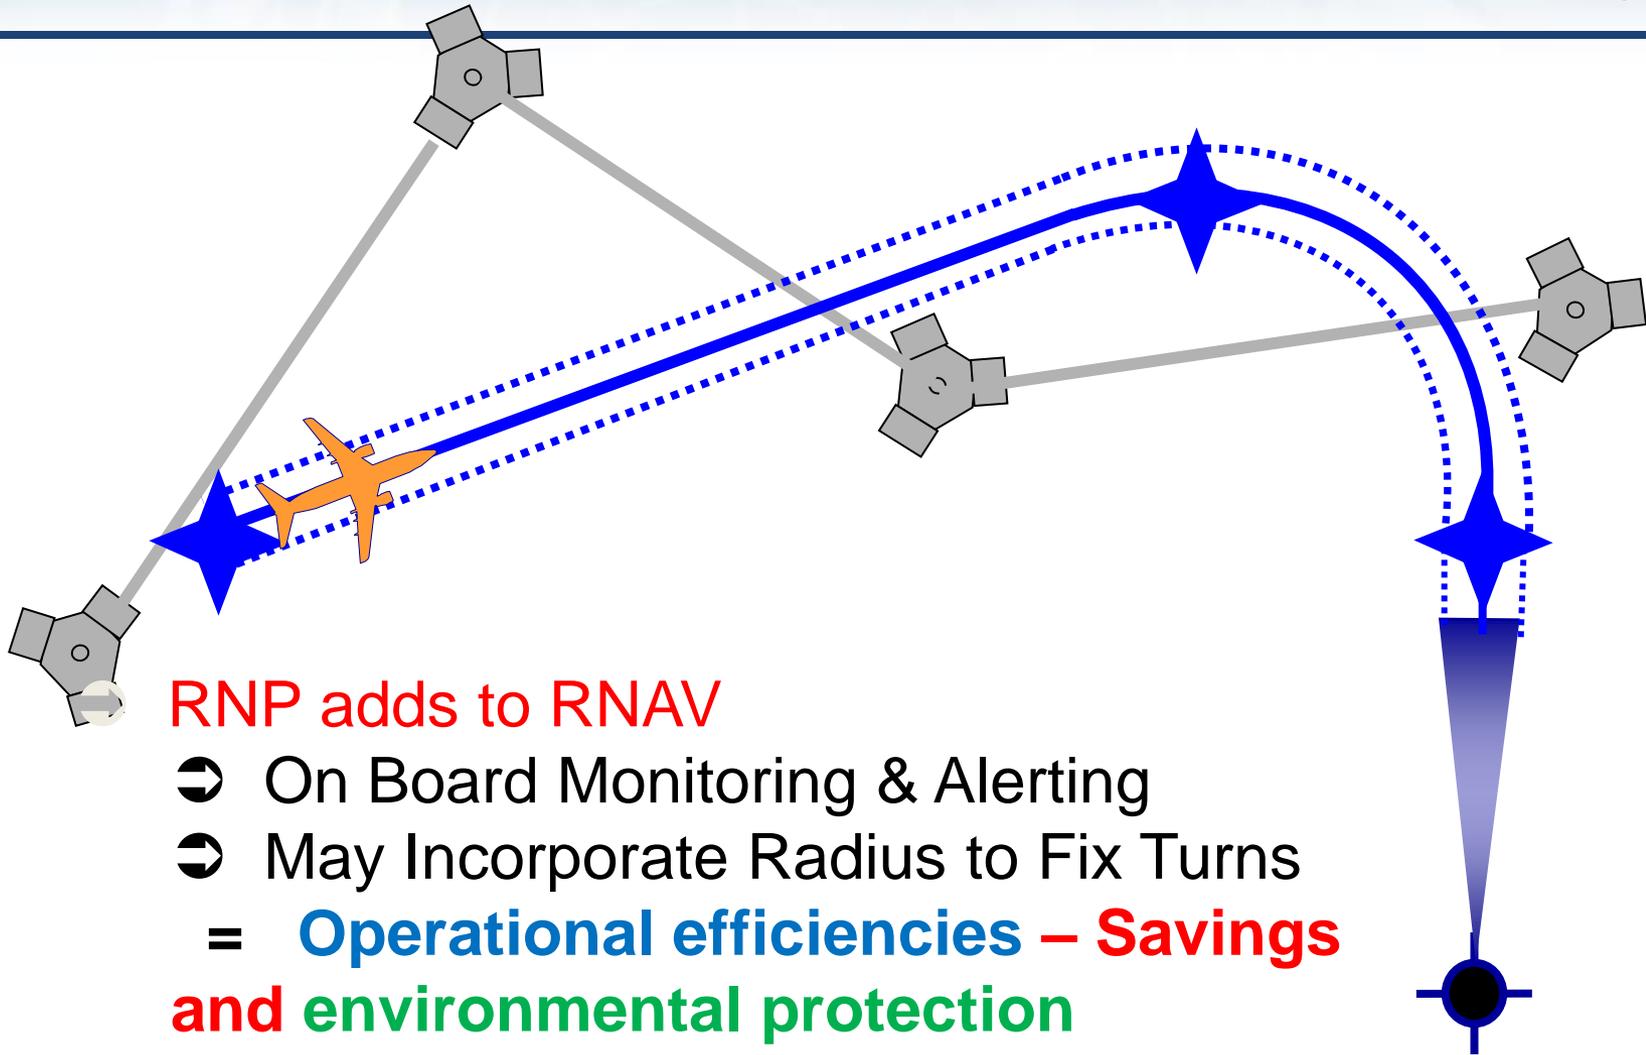

- Navigation based on specified system performance requirements for aircraft operating on a air traffic route, instrument approach procedure, or in a designated airspace
 - Potential for aircraft to demonstrate requirements compliance through a mix of capabilities, rather than only specific equipment
 - Regulators will not always need to write new compliance documents for new capabilities

PBN (Cont.)

- The technology supporting RNAV (the stem of PBN) has advanced from terrestrial to space-based, providing significant flexibilities
- GNSS (GPS, GLONASS, etc.; augmentations)

PBN (Cont.)

RNP adds to RNAV

- ➔ On Board Monitoring & Alerting
 - ➔ May Incorporate Radius to Fix Turns
- = **Operational efficiencies – Savings**
and environmental protection

Operational improvements

Environmental protection related operational improvements

- Direct routing particularly for short segments
- Multiple routes to provide flexibility – long sectors
- Predictable **availability of optimum flight levels**
- **Cruise climb** in certain airspaces
- Navigation through/by special use airspace
- Flexible Use of Airspace (FUA)
- Avoidance of noise sensitive areas
- Terminal area precision: capacity, flexibility
- Enabling Continuous Climb Operations (B0-CCO)
- Enabling Continuous Descent Operations (B0-CDO)
- etc.

PBN routes - Direct routes are preferred on short segments

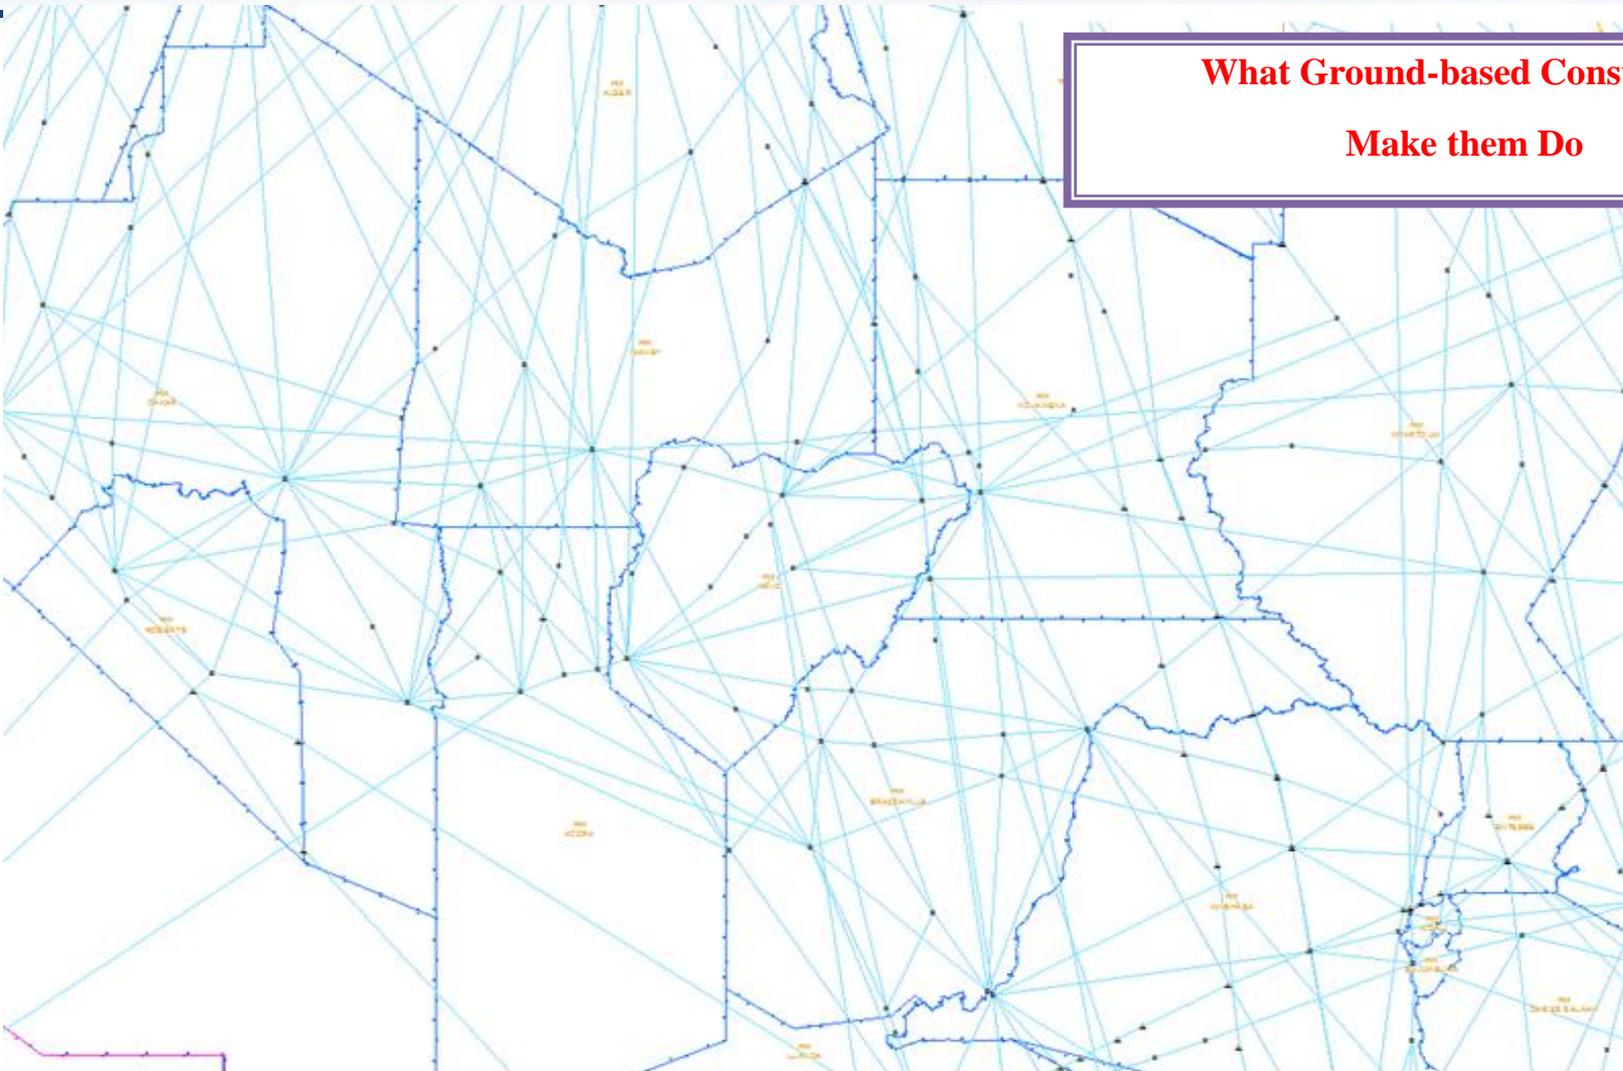

What Aircraft Operations Intend to Achieve

Dependence on age old airspace systems and operations

**What Ground-based Constraints
Make them Do**

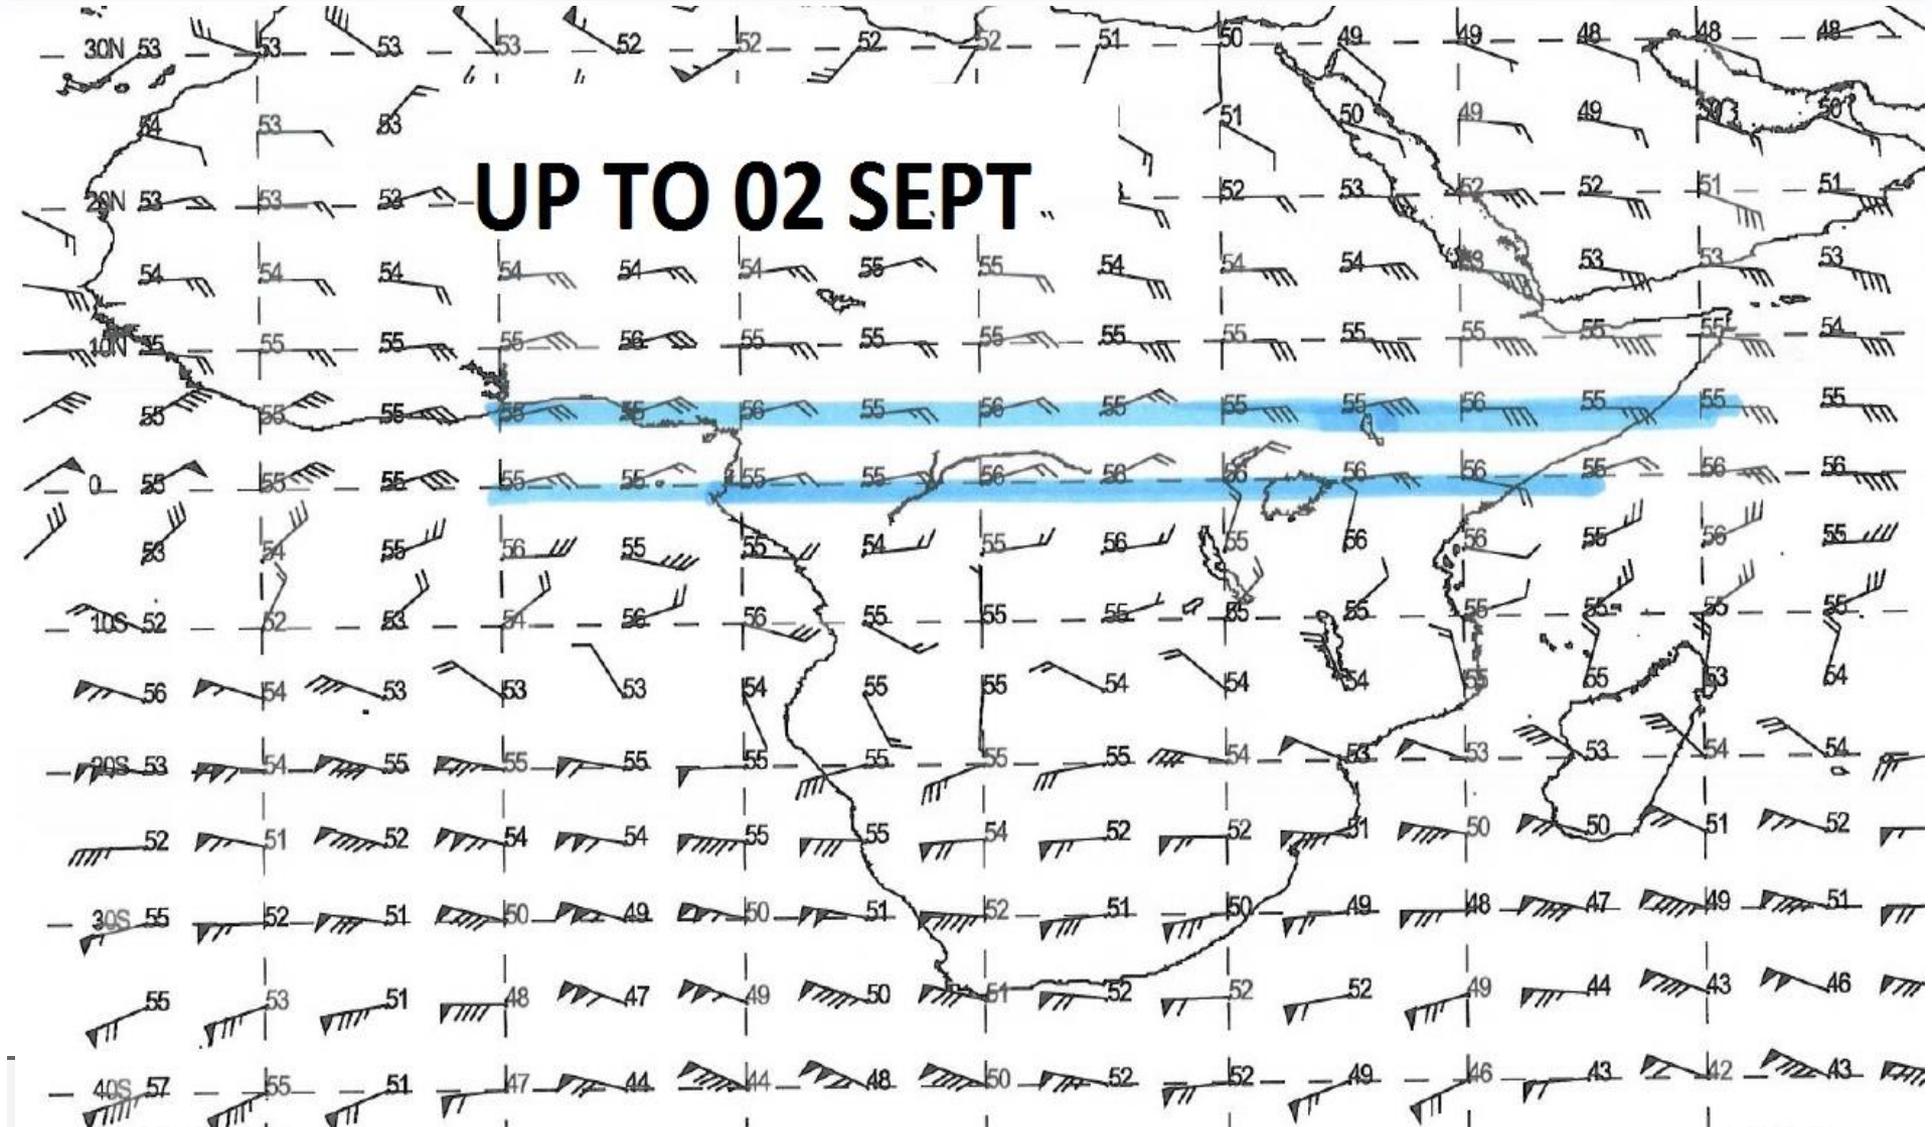

Operational improvements

Flexibility for long distance flights

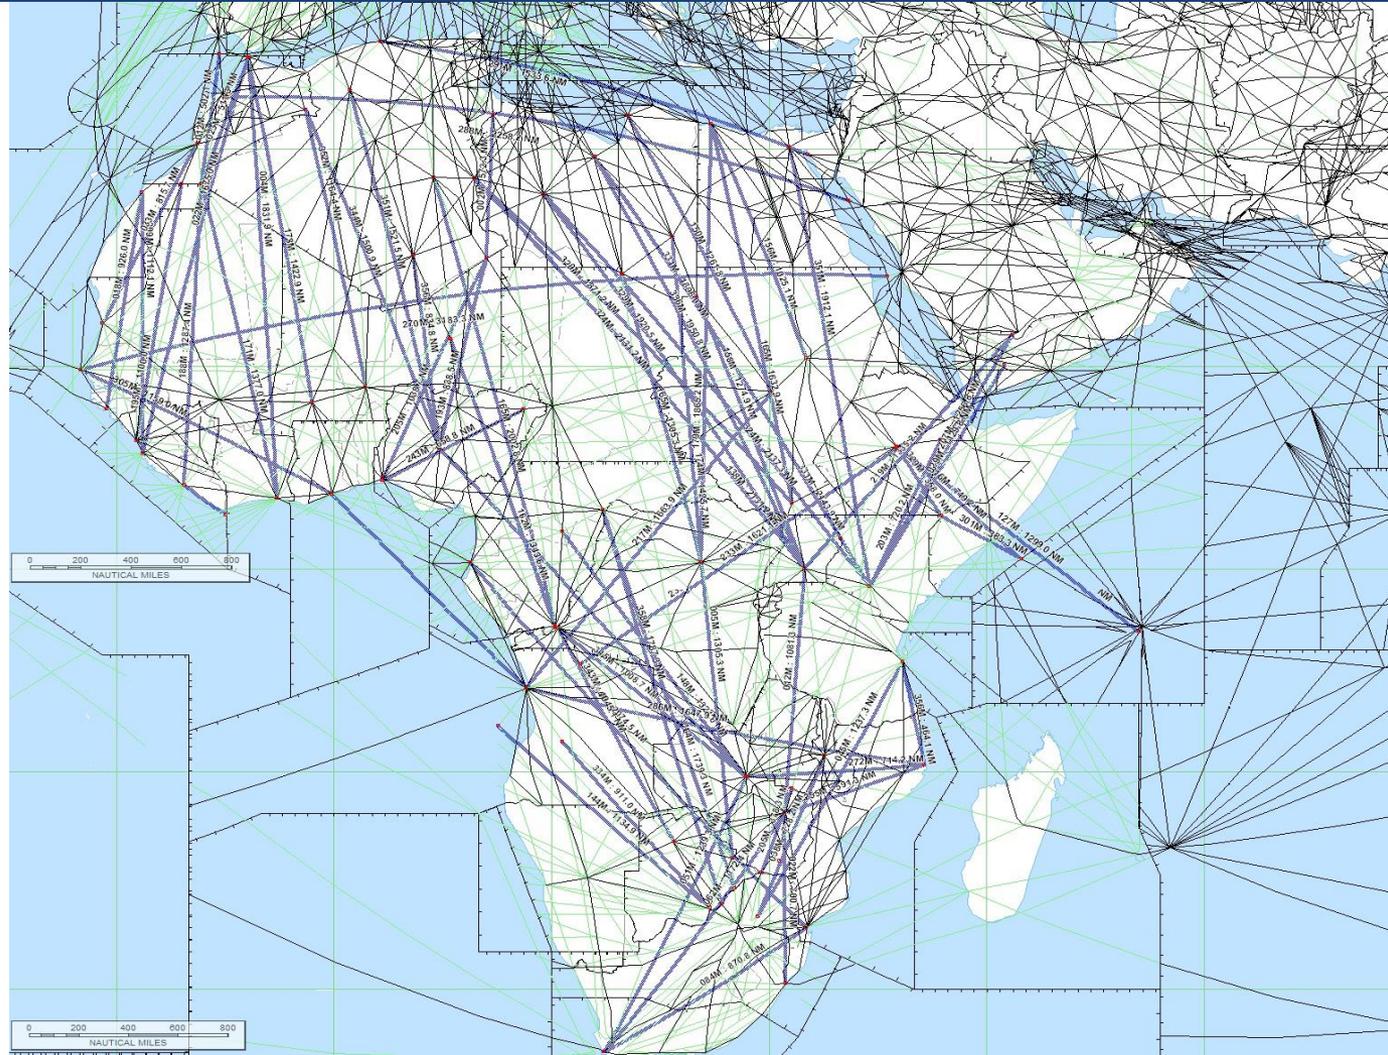

UP TO 02 SEPT

Operational improvements Flexibility for long distance flights

Depending on winds and other weather conditions, a flight operation can select route trajectories with most advantage

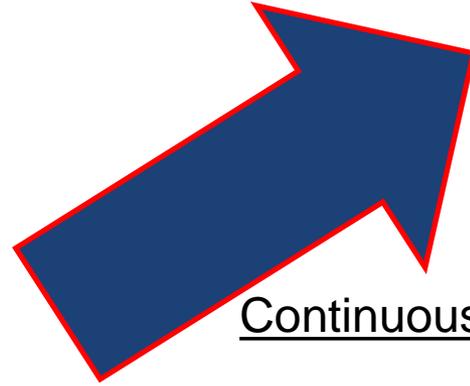

Operational improvements

Flexibility for long distance flights

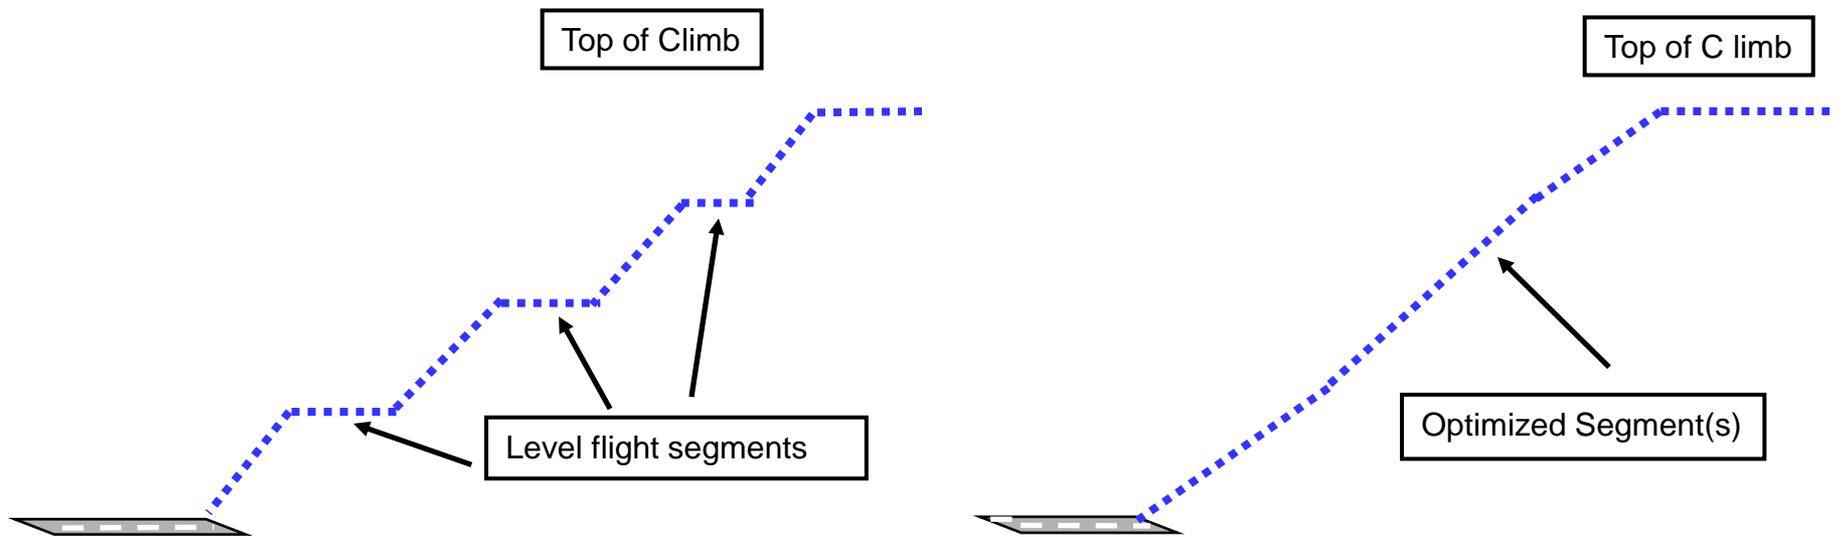

- Recently (April 2014) agreed on over 150 ATS route trajectories
- Prioritized based on benefits and implementation feasibility:
 - High benefits and Ease of implementation
 - High benefits and Lack of ease of implementation
 - Low benefits Ease of implementation
 - Low benefits and Lack of ease of implementation
- Accurate benefits under calculation

Operational improvements Conventional vs. CCO

Conventional Departure

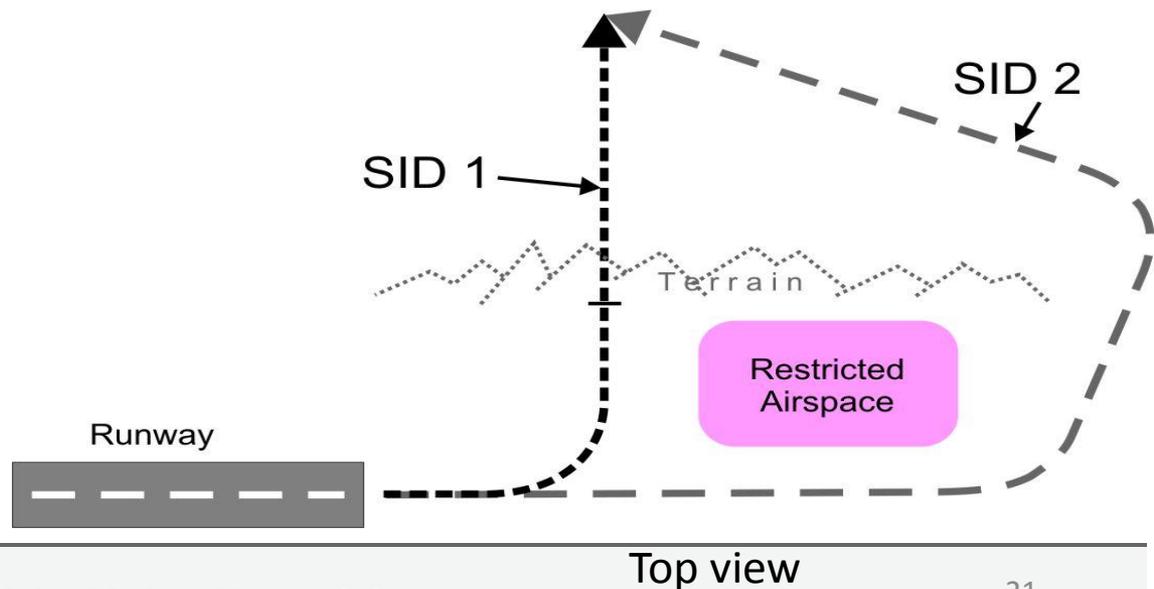

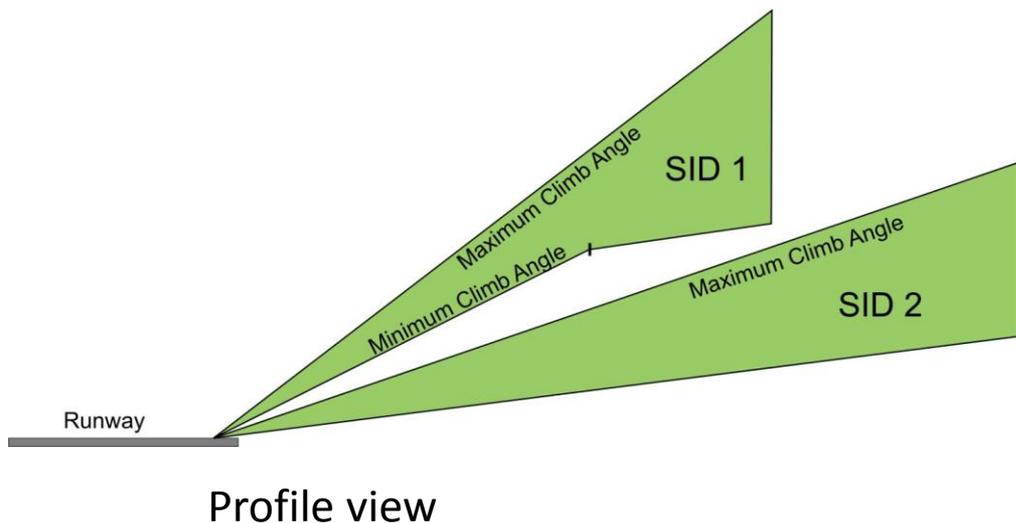

Continuous Climb Operations

Operational improvements Enhanced CCO

Design with multiple climb gradients

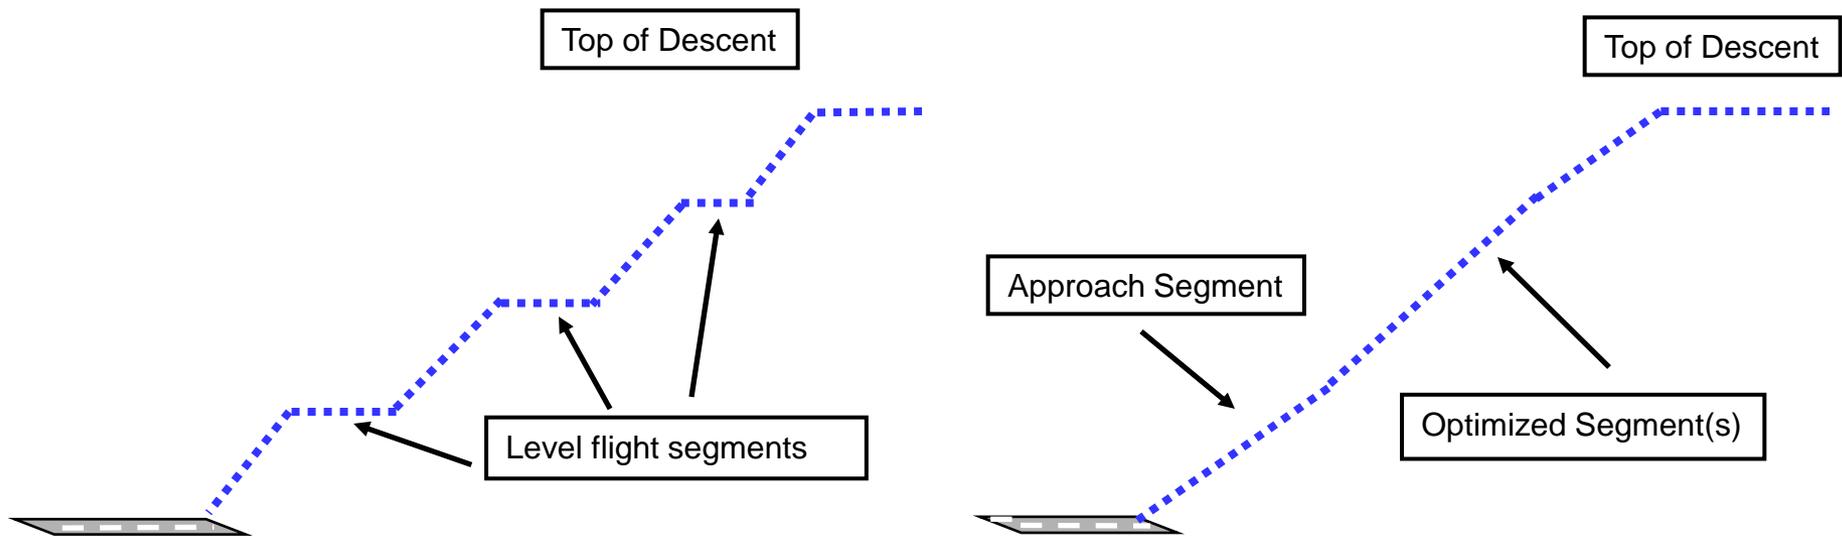

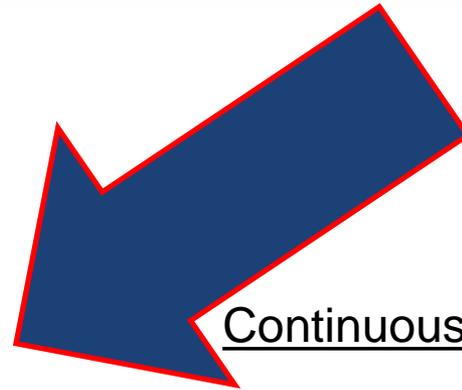

Operational improvements Step-down (Dive and Drive) vs. CDO

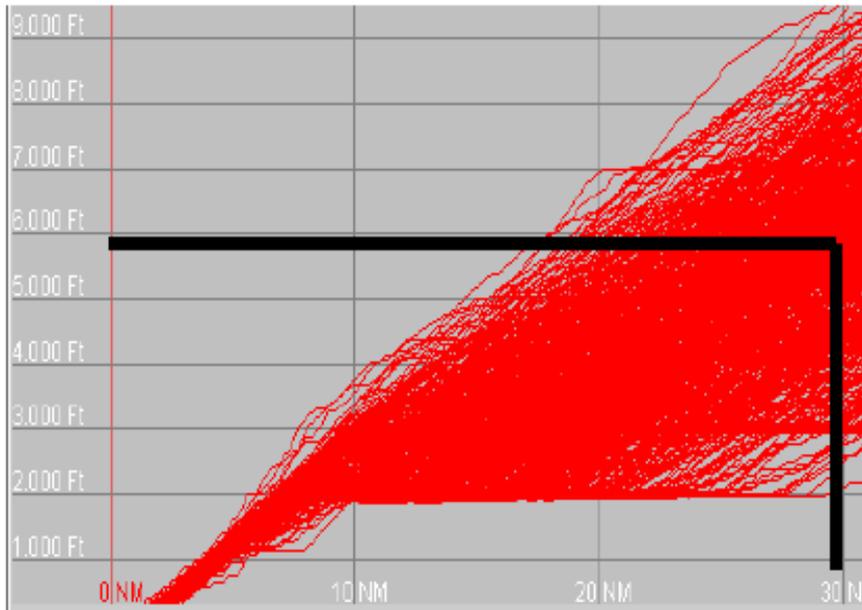

Conventional Step-down

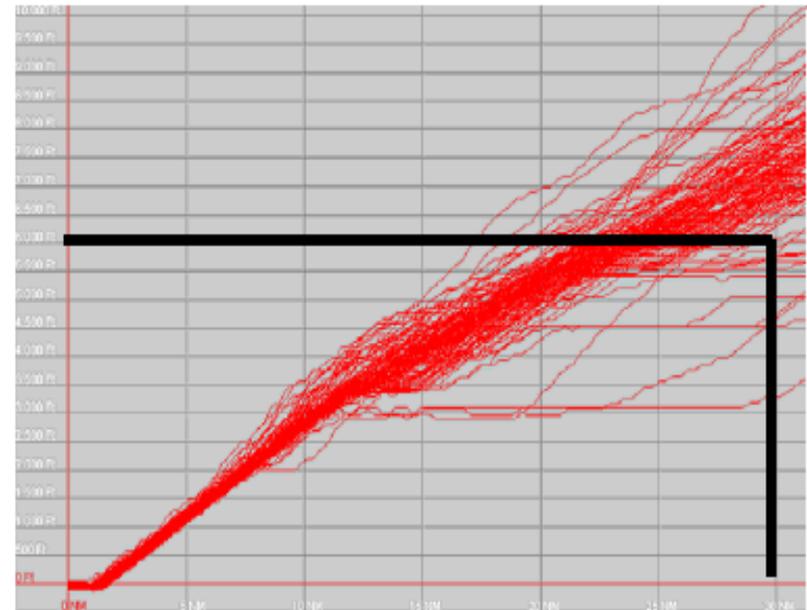

Continuous Descent Operations

Actual CDO Operation

Flight tracks before CDO

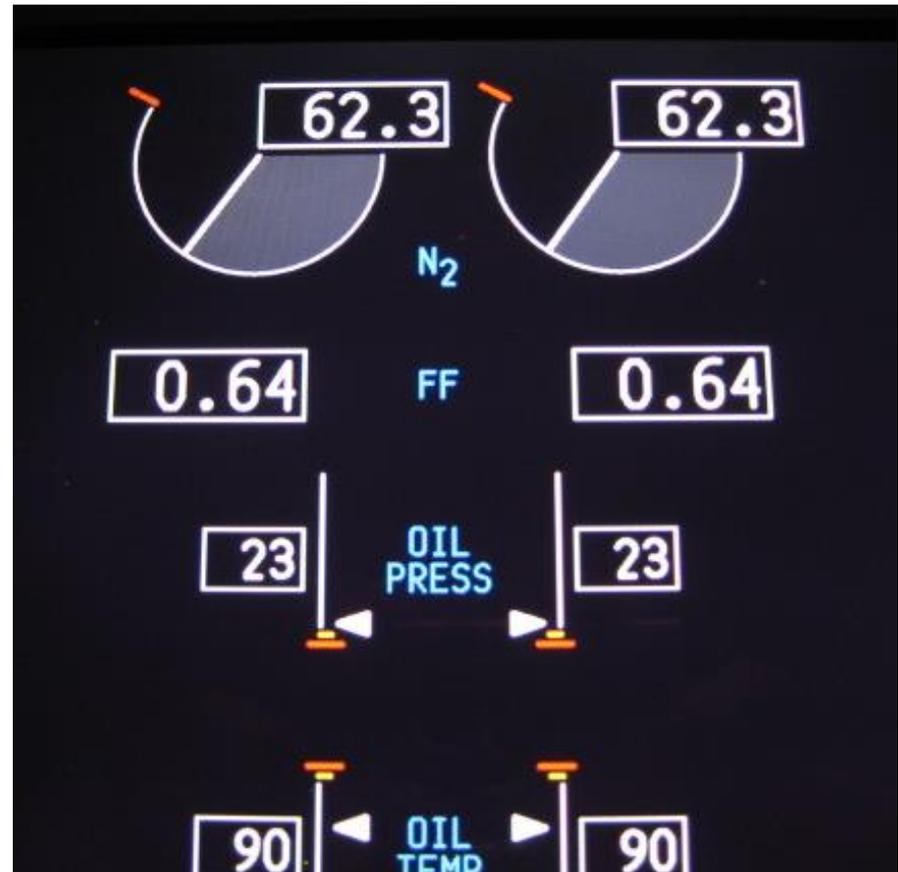

Flight tracks after CDO

Operational improvements

Importance of an Idle Descent

- Idle Descent
- 640 lbs/hr/engine
- 1280 lbs/hr
- 3.2 gal/min

Operational improvements

Level-offs use 4-5 times more fuel

x 3.7=

Level, 210 kt, flaps up

x 4.0=

Level, 180 kt, flaps 5

x 4.4=

Level, 170 kt flaps 10

x 5.5=

Level, 160 kt, flaps 15

Operational Improvements

Airspace concepts – Comprehensive airspace reviews

- Airspace concept workshops and training undertaken in Johannesburg August 2013
- Safety
- Airspace efficiency
- ATS efficiency
- Environment
- Access
- Equity (GA, AT, etc.)

Thank You

A world map is shown in a light blue color. Eight colored dots (one orange for Montreal, seven blue for other offices) are placed on the map, with thin lines connecting them to their respective text labels. A large, rounded rectangular box with a gradient background and a dark border is centered over the map, containing the text 'Thank You' in a bold, dark blue font.
