T7/7 - 0229

20 March 2012

Subject:

Workshop on Preparations for AN-Conf/12 - ASBU methodology, Dakar, Senegal, 16 -20 July 2012.

Action required: advise by 16 May 2012 the names of participants.

Sir/Madam,

I have the honour to inform you that ICAO will be holding a workshop on Preparations for 12 Air Navigation Conference (AN-Conf/12) - Aviation System Block Upgrades (ASBU) methodology. The workshop will be held from 16 to 20 July 2012 in Dakar, Senegal. I hereby extend an invitation to your Administration to participate in this workshop.

The 37th Session of the ICAO General Assembly held in 2010 directed the Organization to double its efforts to meet the global requirements for airspace interoperability while maintaining its focus on safety. Furthermore, the need was recognized to integrate the air, ground and regulatory parts in air navigation infrastructure planning by addressing flight trajectories as a whole, distributing the decision-making process, taking into account safety risks and recognizing the role of the human element in the change-process. In response to these developments, ICAO initiated the ASBU methodology as a global framework that comprises a suite of modules, which are organized into flexible and scalable building blocks and can be implemented in a State or a region depending on the need and level of readiness.

The ASBU initiative will be integrated in the revised Global Air Navigation Plan (GANP, Doc 9750) with intent to seek the endorsement of ANConf/12 scheduled to take place from 19 to 30 November 2012 under the single sky concept. The revised GANP will also include related technology roadmaps such as CNS, AIM, and Avionics. Consequential amendments will also take place in the Regional and National Performance Framework for Air Navigation Systems and reflected appropriately in the air navigation plans.

../..

Tél.: + 221 33 869 24 24 Télécopie: +221 820 32 59

Courriel: icaowacaf@dakar.icao.int

The successful rollout of the ASBU concept and modules/technologies will depend on well synchronized strategies for education and training that would also facilitate discussions during the ANConf/12. As a result, significant efforts are underway to familiarize States, Regulators, Service Providers, Airline Operators, Military and International Organizations on the concept of ASBUs as well as the agenda of ANConf/12. Following this, the Secretary General established a Special Implementation Project (SIP) consisting of a workshop on "Preparations for AN-Conf/12 – ASBU methodology ", for the States of the Western and Central African Region, in order to provide requisite training in the development of performance framework for air navigation systems using ASBU methodology.

The objective of the workshop is to share with the participants understanding of the air navigation performance planning process through the revised Global plan and ASBU methodology, reviewing related technology roadmaps such as CNS, AIM and Avionics, whilst assessing regulatory needs, defining operational improvements, developing business cases, determining performance metrics and evaluating fuel savings and corresponding environmental benefits through the ICAO Fuel Savings Estimation Tool (IFSET). The workshop, through specially designed hands-on exercises, would provide the participants with practical experience for the development of national performance framework on the basis of the ASBU concept and with understanding of its impact on Regional Air Navigation Plans. Also, the outcome of this workshop would enable the States to prepare for their participation in the upcoming ANConf/12.

In order to conduct the hands-on exercises efficiently, meaningfully and within the time frame of the workshop, you are requested to advise your participants to review the background information on ASBUs (Attachment A) as well as the agenda of the workshop (Attachment B) and bring along with them a copy of the national air navigation plan of your State, and relevant air traffic forecast data to the workshop. In this regard, please note that as the workshop covers all disciplines of air navigation systems, I would encourage participation of experts from your State representing the fields of OPS/ATM/CNS/ MET/ AIM/ AGA as you consider appropriate.

The working language of the workshop will be English with simultaneous interpretation in French. The daily subsistence travel allowance in addition to other costs for participants are the responsibility of the nominating States. The registration form is at Attachment C and the Information Bulletin at Attachment D,

In order to proceed with the planning for the workshop, you are kindly requested to provide, by 16 May 2012, the names and designation of your nominated participants.

Please accept, Sir/Madam, the assurances of my highest consideration.

Mam Sait Jallow Regional Director

BACKGROUND INFORMATION ON AVIATION SYSTEM BLOCK UPGRADES (ASBUs)

WORKING DOCUMENT
ON THE
AVIATION SYSTEM BLOCK UPGRADES

THE FRAMEWORK
FOR GLOBAL HARMONIZATION

ISSUSED: 16 NOVEMBER 2011

SECOND VERSION TO THE WORKING DOCUMENT FOR THE GLOBAL AIR NAVIGATION INDUSTRY SYMPOSIUM (GANIS)

Preface to this Edition

The International Civil Aviation Organization established a framework for global harmonization and interoperability of air space named the aviation system block upgrades (ASBUs). These are sets of capabilities that provide measurable, operational performance improvements organized into flexible and scalable building blocks that can be introduced and implemented as needed.

Draft ASBUs were presented at the Global Air Navigation Industry Symposium (GANIS), which was held at ICAO in September 2011, and were integrated in the GANIS working document. Since then, constructive feedback forms were received from both States and the Industry and all comments were reviewed by the Future Aviation Technical Team.

Based on the review of the Technical Team, the ASBUs have been revised and are available for review and comment using the forms provided for this purpose at http://www2.icao.int/en/GANIS/Pages/Aviation-System-Block-Upgrades.aspx. Feedback is of particular importance because the ASBUs will form part of the Global Air Navigation Plan (GANP) which will be the subject of a working paper at the Twelfth Air Navigation Conference (AN-Conf/12).

ICAO Aviation System Block Upgrades

Introduction

The 37th Session of the International Civil Aviation Organization (ICAO) Assembly (2010) directed the Organization to increase its efforts to meet the global needs for airspace interoperability while maintaining its focus on safety. ICAO therefore introduced the "Aviation System Block Upgrades" initiative as a programmatic framework that:

- a) develops a set of air traffic management (ATM) solutions or upgrades;
- b) takes advantage of current equipage;
- e) establishes a transition plan; and
- d) enables global interoperability.

ICAO estimates that US\$120 billion will be spent on the transformation of air transportation systems in the next ten years. While NextGen and SESAR in the United States and Europe account for a large share of this spending, parallel initiatives are underway in many areas including the Asia/Pacific, North and Latin America, Russia, Japan and China. Modernization is an enormously complex task but the Industry needs the benefits that these initiatives will bring as traffic levels continue to rise. It is clear that to safely and efficiently accommodate the increase in air traffic demand, as well as to respond to the diverse needs of operators, the environment and other issues, a renovation of ATM systems is needed to provide the greatest operational and performance benefits.

Aviation system block upgrades comprise suites of modules, each having the following essential elements:

- a) a clearly defined and measurable operational improvement and success metric;
- necessary equipment and/or systems in aircraft and on the ground, along with an operational approval or certification plan;
- c) standards and procedures for both airborne and ground systems; and
- a positive business case over a clearly defined period of time.

Modules are organized into flexible and scalable building blocks that can be introduced and implemented in a State or a region depending on need and level of readiness, while recognizing that all the modules are not required in all airspaces.

The concept of the block upgrades originates from existing near-term implementation plans and initiatives providing benefits in many regions of the world. The block upgrades are largely based on operational concepts extracted from the United States' Next Generation Air Transportation System (NextGen), Europe's Single European Sky ATM Research (SESAR) and Japan's Collaborative Actions for Renovation of Air Traffic Systems (CARATS) programmes. Also included was the feedback from States with evolving modernization programmes received at the recent Global Air Navigation Industry Symposium. The block upgrades are also aligned with the ICAO Global Air Traffic Management Operational Concept (Doc 9854). The intent is to apply key capabilities and performance improvements

drawn from these programmes across other regional and local environments with the same level of performance and associated benefits on a global scale.

The block upgrades describe ways to apply the concepts defined in the ICAO Global Air Navigation Plan (Doc 9750) with the goal of achieving regional performance improvements. They will include the development of technology roadmaps to ensure that standards are mature and to facilitate synchronized implementation between air and ground systems and between regions. The ultimate goal is to achieve global interoperability. Safety demands this level of interoperability and harmonization which must be achieved at a reasonable cost with commensurate benefits.

Leveraging upon existing technologies, block upgrades are organized in five-year time increments starting in 2013 continuing through 2028 and beyond. Such a structured approach provides a basis for sound investment strategies and will generate commitment from States, equipment manufacturers, operators and service providers.

The block upgrades will be formalized at the Twelfth Air Navigation Conference in November 2012 and will form the basis of the new or revised Global Air Navigation Plan (GANP).

The development of block upgrades will be realized by a shift in focus from top-down planning to more bottom-up and pragmatic implementation in the regions. The ASBU initiative will influence ICAO's work programme in the coming years, specifically in the area of standards development and associated performance improvements.

Stakeholder Roles and Responsibilities

Stakeholders, including service providers, regulators, airspace users and manufacturers, will face increased levels of interaction as new, modernized ATM operations are implemented. The highly integrated nature of capabilities covered by the block upgrades requires a significant level of coordination and cooperation among all stakeholders. Working together is essential for achieving global harmonization and interoperability.

For ICAO and its governing bodies, the block upgrades will enable the development and delivery of necessary Standards and Recommended Practices (SARPs) to States and Industry in a prompt and timely manner to facilitate regulatory and technological improvement and to ensure operational benefits worldwide. This process will be facilitated by the standards roundtable process, which involves ICAO, States and Industry, and by various technological roadmaps.

States, operators and Industry will benefit from the availability of SARPs with realistic lead times. This will allow regional regulations to be identified, the development of adequate action plans and, if needed, investment in new facilities and/or infrastructure.

Stakeholders worldwide must prepare the ATM system for the future. The block upgrades initiative should constitute the basis for future ATM modernization plans. Where plans are already in place, they should be aligned with objectives defined in the block upgrades.

For the Industry, the ASBU initiative forms the basis for planning future development and delivering products to the market at the proper target time.

For service providers or operators, block upgrades should serve as a planning tool for resource management, capital investment, training, as well as for potential reorganization.

What is an Aviation System Block Upgrade?

An aviation system block upgrade (ASBU) designates a set of improvements that can be implemented globally to enhance the performance of the ATM system. There are four components of a block upgrade.

<u>Module</u> — a deployable package based on performance or capability. It offers a clear operational benefit, supported by procedures, technology, regulation/standards as necessary, and a business case. A module will be also characterized by the operating environment within which it may be applied.

It is important that each module be both flexible and scalable to the point where its application could be managed through any set of regional plans and still realize the intended benefits. The preferential basis for the development of the modules relied on the applications being adjustable to fit many regional needs as an alternative to being made mandated as a one-size-fits-all application. Even so, it is clear that many of the modules developed in the block upgrades will not be necessary to manage the complexity of air traffic management in many parts of the world.

<u>Thread</u> — a series of dependent modules reaching across successive block upgrades which represents a coherent evolution over time from basic to more advanced capability and associated performance while reflecting key aspects of the global ATM concept. The date considered for allocating a module to a block is that of the initial operating capability (IOC)

Block — is made up of modules that, when combined, enable significant improvements and benefits.

The notion of blocks is based on five year intervals. Detailed block descriptions can include more accurate implementation dates, often not at the exact reference date of a block. The purpose, however, is not to indicate when a module implementation must be completed, unless dependencies among modules logically suggest such a completion date.

<u>Performance Improvement Area (PIA)</u> — sets of modules in each block are grouped to provide operational and performance objectives in the environment to which they apply, thus forming executive high-level view of the intended evolution. The PIAs facilitate comparison of ongoing programmes.

The four performance improvement areas are as follows:

- 1. Greener Airports
- Globally Interoperable Systems and Data through globally interoperable system-wide information management
- 3. Optimum Capacity and Flexible Flights through global collaborative ATM
- Efficient Flight Path through trajectory-based operations

Figure 1 illustrates the relationships between the modules, threads, blocks, and performance improvement areas.

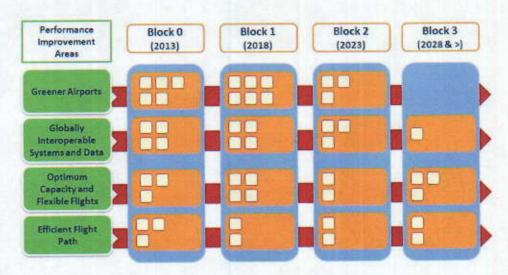

Figure 1. Summary of Blocks Mapped to Performance Improvement Areas

Note that each block includes a target year. Each of the modules that form the block must meet a readiness review that looks at the availability of standards (including performance standards, approvals, advisory and guidance documents, etc.), avionics, infrastructure, ground automation and other enabling capabilities. To provide a community perspective each module should have been fielded in two regions and should include operational approvals and procedures. This allows States wishing to adopt the blocks to draw on the experience gained by those already employing those capabilities.

Figure 2 illustrates the relative timing of each block. Note that early lessons learned are included in preparation for the initial operating capability date. For the Twelfth Air Navigation Conference it is recognized that Blocks 0 and 1 represent the most mature of the modules. Blocks 2 and 3 provide the necessary vision to ensure that earlier implementations are on the path to the future.

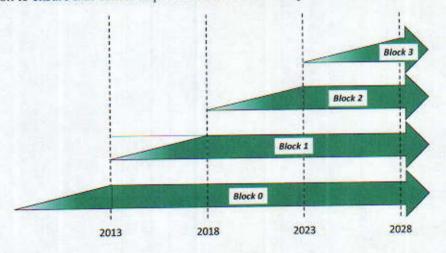

Figure 2. Timing Relationships Between Blocks

An illustration of the improvements brought by Block 0 for the different phases of flight is presented in Figure 3. It highlights that the proposed improvements apply to all flight phases, well as to the network as a whole, to information management and to infrastructure.

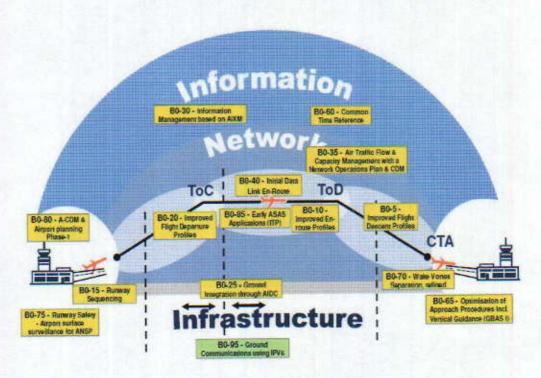

Figure 3. Block 0 in perspective

Global Air Navigation Plan

The GANP is a strategic document that has successfully guided the efforts of States, planning and implementation regional groups (PIRGS) and international organizations in enhancing the efficiency of air navigation systems. It contains guidance for systems improvements in the near- and medium-term to support a uniform transition to the global ATM system envisioned in the Global ATM Operational Concept. Long-term initiatives from the operational concept, however, are maturing and GANP must be updated to maintain its relevance and compatibility.

The United States and Europe share a common ATM modernization challenge as both operate highly complex, dense airspace in support of their national economies. Although quite different in structure, management and control, their systems are built on a safety-focused infrastructure while actively seeking and delivering the required efficiency gains. The United States has a single system that spans the entire country while Europe's is a patchwork of systems, service providers and airspace defined mostly by State boundaries. Both legacy infrastructures must migrate to a new, upgraded and modernized operational paradigm.

Over the past ten years, as the ATM operational concepts were developed, the need was recognized to:

- a) integrate the air, ground and regulatory parts, including airport operations, by addressing flight trajectories as a whole and sharing accurate information across the ATM system;
- b) distribute the decision-making process;
- c) address safety risks; and
- d) change the role of the human being using improved integrated automation.

These changes will support new capacity-enhancing operational concepts and enable the sustainable growth of the air transportation system.

ICAO aims for the block upgrades initiative to become the global approach for facilitating interoperability, harmonization, and modernization of air transportation worldwide. As implementation proceeds, the highly integrated nature of the block upgrades will necessitate transparency between all stakeholders to achieve a successful and timely ATM modernization.

The Twelfth Air Navigation Conference provides the opportunity for significant progress and to arrive at decisions for the globally coordinated deployment of the block upgrades, progress reviews and updates are planned at regular intervals following the first application the block upgrades.

Conclusion

The global aviation system block upgrade initiative constitutes a worldwide framework for ATM system modernization. Offering a structure based on expected operational benefits, it will facilitate investment and implementation processes, by clarifying the clear relationship between technology and operational improvements.

However, block upgrades will only play their intended role if sound and consistent technology roadmaps are developed and validated. As well, all stakeholders involved in worldwide ATM modernization should align their activities and planning to the related block upgrades. The challenge of the Twelfth Air Navigation Conference will be to establish a solid and worldwide endorsement of the aviation system block upgrades as well as the related technology roadmaps into the revised Global Air Navigation Plan, under the concept of One Sky.

Appendix A: Summary Table of Aviation System Block Upgrades Mapped to Performance Improvement Areas

Performance Improvement Area 1: Greener Airports

Block 0 B0-65 Optimization of approach procedures including vertical guidance This is the first step toward universal implementation of GNSS-based approaches B0-70 Increased Runway Throughput through Wake Turbulence Separation	Block 1 B1-65 Optimized Airport Accessibility This is the next step in the universal implementation of GNSS-based approaches B1-70 B1-70 B1-70 B2-70 (*) Advanced Wake Turbulence Separation Wake Turbulence Separation Wate Turbulence Separation	Block 2 B2-70 (*) B2-70 (*) C Advanced Wake Turbulence Separation (Time-based)
B0-70 Increased Runway Throughput through Wake Turbulence Separation Improved throughput on departure and arrival runways through the revision of current ICAO wake vortex separation minima and procedures	B1-70 Increased Runway Throughput through Dynamic Increased Runway Throughput through Dynamic Make Turbulence Separation Improved throughput on departure and arrival runways through the dynamic management of wake vortex separation minima based on the real-time identification of wake vortex hazards	
B0-75 Improved Runway Safety (A-SMGCS Level 1-2 and Cockpit Moving Map) Airport surface surveillance for ANSP	B1-75 Enhanced Safety and Efficiency of Surface Operations (ATSA-SURF) Airport surface surveillance for ANSP and flight crews with safety logic, cockpit moving map displays and visual systems for taxi operations	B2-75 Optimized Surface Routing and Safety Benefits (A-SMGCS Level 3-4, ATSA-SURF IA and SVS) Taxi routing and guidance evolving to trajectory based with ground/cockpit monitoring and data link delivery of clearances and information. Cockpit synthetic visualization systems
B0-80 Improved Airport Operations through Airport-CDM Airport operational improvements through the way operational partners at airports work together	B1-80 Optimized Airport Operations through Airport- CDM Total Airport Management Airport operational improvements through the way operational partners at airports work together	
	B1-81 Remote Operated Aerodrome Control T The performance objective is to provide safe and cost-effective ATS to aerodromes where dedicated local ATS is no longer sustainable or cost effective, but where there is a local economic and social benefitrom aviation	and the second s
B0-15 Improved RunwayTraffic Flow through Sequencing (AMAN/DMAN) Time-based metering to sequence departing and arriving flights	B1-15 Improved Airport Operations through Departure, Surface and Arrival Management Extended arrival metering, integration of surface management with departure sequencing bring robustness to runway management and increase	B2-15 Linked AMAN/DMAN Synchronized AMAN/DMAN will promote more agile and efficient en-route and terminal operations

Performance Improvement Area 2: Globally Interoperable Systems and Data – Through Globally Interoperable System Wide Information Management

ode itive nous	B3-25 Improved Operational Performance through the Introduction of Full FF-ICE All data for all relevant flights systematically shared between air and ground systems using SWIM in support of collaborative ATM and trajectory-based operations	ntre 1d ons	Block
B2-31 Enabling Airborne Participation in Collaborative ATM through SWIM Connection of the aircraft an information node in SWIM enabling participation in collaborative ATM processes with access to rich, voluminous and dynamic data including meteorology		B2-25 Improved Coordination through Multi-centre Ground-Ground Integration: (FF-ICE/1 and Flight Object, SWIM) FF-ICE supporting trajectory-based operations through exchange and distribution of information for multicentre operations using flight object implementation and IOP standards	Block 2
B1-31 Performance Improvement through the Application of System-Wide Information Management (SWIM) Implementation of SWIM services (applications and infrastructure) creating the aviation intranet based on standard data models, and internet-based protocols to maximize interoperability	B1-30 Service Improvement through Integration of All Digital ATM Information Implementation of the ATM information reference model integrating all ATM information using UML and enabling XML data representations and data exchange based on internet protocols with WXXM for meteorological information	B1-25 Increased Interoperability, Efficiency and Capacity though FF-ICE/1 Application before Departure Introduction of FF-ICE step 1 to implement ground-ground exchanges using common flight information reference model, FIXM, XML and the flight object used before departure	Block 1
	B0-30 Service Improvement through Digital Aeronautical Information Management Initial introduction of digital processing and management of information through the implementation of AIS/AIM making use of AIXM, moving to electronic AIP and better quality and availability of data	B0-25 Increased Interoperability, Efficiency and Capacity through Ground-Ground Integration Supports the coordination of ground-ground data communication between ATSU based on ATS inter-facility data communication (AIDC) defined by ICAO Doc 9694, Manual of Air Traffic Services Data Link Applications	Block 0

ICAO Workshop on Preparations for 12 Air Navigation Conference (AN-Conf/12)
Aviation System Block Upgrades (ASBU) methodology

Dakar, Senegal, 16-20 July 2012

INFORMATION BULLETIN

1. Venue of the Meeting

The Meeting will take place in the conference room of ICAO Regional Office for Western and Central Africa, located around Leopold Sedar Sengor International Airport, Dakar-Yoff, Senegal. The contacts of the WACAF Office are:

Tel.: (+221) 33 869 24 24

Fax: (+221) 33 869 32 59

Web Site: http://legacy.icao.int/wacaf

Email: icaowacaf @dakar.icao.int

2. Languages

The Meeting will be conducted in English and French languages.

3. Opening Session

The Opening Session of the Meeting will take place on Monday 16 July 2012 at 08:30 hours in the ICAO WACAF conference room, where subsequent sessions will also be held.

4. Registration

The registration of participants will take place at the site of the meeting on Monday, 16 July 2012 from 08:00 to 08:30 hours.

5. Instruction and Documentation

The Meeting will be facilitated by Mr Saulo Da Silva, ATM Technical Officer from ICAO Air Navigation Bureau and Mr H. Sudarshan, Consultant for ICAO Air Navigation Bureau.

They will be assisted by Mr. François-Xavier Salambanga, Regional Officer CNS of the ICAO Dakar Office, and local coordinator of the meeting for WACAF. The documentation

for the Meeting will be on line at http://legacy.icao.int/wacaf/meetings and participants are informed to bring laptops for access.

6. Weather and Clothing

July is the beginning of the raining season in Senegal and the average temperature in Dakar is around 25°C.

7. Passport and visa requirements

Entry visa for temporary visitors to Senegal may be obtained from the Senegalese Embassy or Consulate in their country. Participants with no Senegalese embassy or consulate may forward a copy of their valid passport at least one month before their trip at nseck@dakar.icao.int for assistance.

Visas are not required for Nationals from Economic Community Of West African States (ECOWAS).

8. Health

Participants are informed that a valid certificate of vaccination against yellow fever is required.

The participants should ensure that they have applied for a valid health insurance for the coverage of any medical care during their staying in Senegal.

9. Banks

Banks are located not far away from the Airport and are opened from 07:40 to 12:15 hours and 13:40 to 15:45 hours from Monday to Friday.

10. Hotels

A list of recommended hotels is attached hereto and participants are informed that no transport service from the hotels to the meeting place will be made available by ICAO.
