

International Civil Aviation Organization

Council Aviation Recovery Task Force (CART)

High-Level Cover Document

introducing recommendations and guidance of CART
in light of latest developments of the COVID-19 crisis

Montréal, Canada, 5 November 2020

Recommendations

This is a summary of recommendations contained in this Document, which complement the original eleven recommendations of the CART Report¹.

Recommendation 12

States should put in place the necessary measures to mitigate risks associated with prolonged regulatory alleviations and should not extend alleviations (both core and extended COVID-19 Contingency Related Differences (CCRDs)) beyond 31 March 2021, unless circumstances dictate otherwise. In addition, States are encouraged to facilitate access to medical and training facilities, including flight simulation training devices used for flight crew (national and foreign) to maintain their certifications, recency of experience and proficiency.

Recommendation 13

While testing is not universally recommended by public health authorities as a routine health screening method, States contemplating testing in their COVID-19 risk management strategy should apply the approach outlined in the ICAO *Testing and Cross-Border Risk Management Measures Manual*.

Recommendation 14

States considering the formation of a Public Health Corridor (PHC) should actively share information with each other to implement PHCs in a harmonized manner. To facilitate implementation of PHCs, the ICAO Implementation Package (iPack) on establishing a PHC is available to States.

¹ <https://www.icao.int/covid/cart/Pages/CART-Report---Executive-Summary.aspx>

1. SETTING THE SCENE

The COVID-19 pandemic continues to be prevalent around the world, devastating lives and livelihoods of all nations. Social and economic consequences of this public health crisis have already outstripped predictions with greater and longer-than-anticipated destruction to all aspects of the world's economy. As States strive to protect the health of their citizens as a matter of priority, travel restrictions, border closures and other public health mitigation measures have significantly impeded global mobility and freedom of movement, causing disruptions in businesses and supply chains. Among the large number of impacted industries, aviation remains in severe hardship with depressed air travel demand. Recovery prospects remain uncertain, and the resurgence of cases in certain regions is likely to further exacerbate the future outlook.

Confronting this extended scale of challenges, the International Civil Aviation Organization (ICAO) is determined to spare no effort to continuously provide global guidance to make it possible for aviation to restart and recover, as well as support and targeted assistance to States in need under its *No Country Left Behind* (NCLB) initiative. These efforts aim to safeguard the aviation sector against downside risks, restore its growth and establish a more sustainable and resilient aviation system with the ultimate objective of enabling once again the far-reaching benefits of aviation and safely connecting people, cultures and business around the world.

As part of its endeavors, the ICAO Council Aviation Recovery Task Force (CART) has updated the *Take-off: Guidance for Air Travel through the COVID-19 Public Health Crisis* (TOGD) issued in June 2020². Updates focus on the evolving technological and medical advancements in the fight against COVID-19, as well as the feedback received from Member States, international organizations including the World Health Organization (WHO) and regional organizations and industry. The epidemiological situation changes rapidly and requires therefore timely and targeted guidance to effectively support States in their efforts to control the pandemic while pursuing the restart and recovery of aviation. In this regard, specific attention is being brought to testing as a potential means to alleviate quarantine measures and thus facilitate international movement of people and goods, as part of a multilayer risk management strategy.

Recognizing the sovereignty and authority of States over their national recovery, the importance of globally- and regionally-harmonized, mutually-accepted measures cannot be overemphasized, taking into consideration available public health capacities. States are urged to follow this updated guidance to align their approaches while upholding each State's prerogative to implement additional and/or alternative mitigation measures in accordance with their specific needs and circumstances. Collective, coordinated and devoted efforts of States and the industry to mitigate the risks through a combination of measures will be the key to the restart and recovery of aviation and strengthen public confidence in air travel. This is the prerequisite and the only sustainable solution to overcome the economic and financial situation that the industry currently faces.

2. NEW AND UPDATED GUIDANCE

The updated TOGD provides States with a risk management approach and up-to-date guidance to protect air passengers and aviation workers from COVID-19. New or updated guidance addresses, inter alia, general hygiene, face coverings and medical masks, health screening and declarations, air passengers with reduced mobility, testing, as well as mental health and well-being of both aviation

² <https://www.icao.int/covid/cart/Pages/CART-Take-off.aspx>

workers and passengers. In addition to the existing Modules on airport, aircraft, crew and cargo, references were included to introduce new risk mitigation measures applicable to other aviation sectors, including air traffic services, business aviation operations and general aviation.

Aviation safety-related measures. As States work to restart air travel, a large proportion of the global fleet, air crew, airport operations staff, and air traffic controllers that have been inactive for prolonged periods will need to be reactivated and retrained, where appropriate. To ensure a safe restart, States should take the necessary steps to mitigate the safety risks associated with such reactivation.

States that have filed differences for temporary departures from ICAO Standards under the COVID-19 Contingency Related Differences (CCRD), or that have granted other COVID-19-related regulatory alleviation, are reminded that these differences and alleviations were intended to be temporary in nature. Prolonged differences and alleviations, such as those related to personnel certification and licensing, could result in an elevated operational safety risk. States should, therefore, put in place the necessary measures to manage those risks and should not extend alleviations (both core and extended CCRDs) beyond 31 March 2021, unless circumstances dictate otherwise. States are encouraged to facilitate access to medical and training facilities, including flight simulation training devices used for flight crew (national and foreign) to maintain their certifications, recency of experience and proficiency.

States also are strongly encouraged to refer their operators to the ICAO Operational Safety Measures website³ where links to guidance documents developed by ICAO, ACI, IATA, ICCAIA and others are available to ensure that necessary measures are taken so that flight operations resume in a safe and orderly manner.

Recommendation 12

States should put in place the necessary measures to mitigate risks associated with prolonged regulatory alleviations and should not extend alleviations (both core and extended CCRDs) beyond 31 March 2021, unless circumstances dictate otherwise. In addition, States are encouraged to facilitate access to medical and training facilities, including flight simulation training devices used for flight crew (national and foreign) to maintain their certifications, recency of experience and proficiency.

Testing and cross border risk management measures. The first edition of the TOGD noted that rapid COVID-19 tests available at the time were not recommended due to limitations of testing technology, test performance and operational challenges. Since then, testing technology continues to improve rapidly. In addition, health authorities have gained a greater understanding of how the COVID-19 virus is transmitted and how the effective use of certain tests might contribute to reducing the likelihood of COVID-19 transmission. Furthermore, it was recognized that introducing testing could — if properly implemented in States that assess it as appropriate for their situation — reduce reliance on measures, such as quarantine, that impact on demand for air travel or restrict the movement of persons arriving in a country, which evidence suggests is a disincentive to several important categories of travel.

³ <https://www.icao.int/safety/COVID-19OPS/Pages/operational-safety-measures.aspx>

While testing is not universally recommended by public health authorities, it has been implemented by some States as a routine health screening method for air travellers⁴. CART, therefore, tasked the Collaborative Arrangement for the Prevention and Management of Public Health Events in Civil Aviation (CAPSCA)⁵ to study available testing methods and advise CART on what factors States could consider regarding testing, as well as guidance on how to implement testing as part of an overall risk management strategy should they wish to do so. As a result, it is recommended that States contemplating testing should apply the approach outlined in the ICAO *Testing and Cross-Border Risk Management Measures Manual*. A reference and a link to this Manual is included in section 1.2 of the Appendix to the updated TOGD. If doing so, States are also encouraged to consider affordable testing means to minimize travel costs for passengers, considering the International Health Regulations (IHR)⁶.

This Manual provides assessment tools that States can use to evaluate and implement testing and related mitigation measures as part of their decision-making process, as well as a guideline on how to assess different mitigation strategies and on how these can contribute to public health risk management. To support States in developing a risk management framework that is adapted to sovereign considerations and integrates with existing national frameworks, CAPSCA also developed a generic decision-making tool (Attachment A to the Manual). The tool can be used to determine the inherent and residual risk level of transporting potentially infectious passengers.

Each State will need to conduct its own risk assessment and is encouraged to use the processes outlined in the Manual as the basis for its assessment. Risk tolerance varies between States and depends on many factors, including public health capacity. This has an influence on the amount of residual risk a State can accept. The determination of such level, as well as the policies and measures to mitigate the risk, is not universal and is within specific priorities and authority of each individual State.

The Manual has been developed using the most recent information available. The urgency, rapid development, and observed consequences of the current scenario require an expedited approach to modifying the Manual. Consequently, regular updates to the guidance will be required as the situation evolves, technology advances and more evidence and data become available.

Recommendation 13

While testing is not universally recommended by public health authorities as a routine health screening method, States contemplating testing in their COVID-19 risk management strategy should apply the approach outlined in the ICAO *Testing and Cross-Border Risk Management Measures Manual*.

Public Health Corridors (PHCs). When considering the guidance contained in the updated TOGD and the ICAO *Testing and Cross-Border Risk Management Measures Manual*, States are strongly encouraged to collaborate with each other regarding PHC implementation. A PHC is formed when two or more States agree to recognize the public health mitigation measures each has implemented on one or more routes between their States. To enable such mutual recognition, States are strongly encouraged to actively

⁴ <https://www.who.int/news-room/articles-detail/public-health-considerations-while-resuming-international-travel>
<https://www.paho.org/en/documents/considerations-resuming-non-essential-international-traffic-caribbean-context-covid-19>

⁵ CAPSCA is managed by ICAO and brings together public health authorities such as the WHO, the European Centre for Disease Control, the United States Centers for Disease Control and Prevention, aviation industry organizations, and aviation medicine and emergency management officials from ICAO Member States' authorities.

⁶ <https://www.who.int/health-topics/international-health-regulations>

share information with other States and enter into bilateral or multilateral discussions with each other to implement PHCs in a harmonized manner. To facilitate implementation of PHCs, the ICAO Implementation Package (iPack) on establishing a PHC is available to States⁷.

Recommendation 14

States considering the formation of a PHC should actively share information with each other to implement PHCs in a harmonized manner. To facilitate implementation of PHCs, the iPack on establishing a PHC is available to States.

3. WAY FORWARD

A global crisis calls for a globally-harmonized response. States must stand together and support each other to protect the health of people, ensure passengers are willing to travel again, and overcome the enormous economic and societal challenges on multiple fronts. Restoration of air connectivity is vital for millions of livelihoods and businesses that rely on cross-border travel, and so it is crucial for the recovery of the global economy. Collective engagement of States and industry serves as the main engine to navigate aviation through the course of restart, recovery and resilience. In this vein, ICAO reaffirms its commitment to providing support as required.

The impact of the COVID-19 pandemic sheds light on areas where improvement can or should be made. Lessons learnt from past and current efforts by all stakeholders fighting the pandemic further underscore the need for a systematic and programmatic risk management approach to mitigate its adverse impact on international air travel, including evaluation of measures and technologies to aid in decision making. States and international organizations should work towards a framework for the harmonization of test result certificates and for ensuring their validity. While the current crisis mobilizes the efforts of all stakeholders to address immediate challenges, it is equally important for States and industry to improve risk management and crisis preparedness to make post-COVID-19 aviation more sustainable and resilient.

The COVID-19 pandemic is not only a health crisis, it is also an economic, social and humanitarian crisis. Considering the dramatic global economic and social impact that the crisis has engendered, the aviation system is standing on the doorstep of rapid transformation. Evaluation and understanding of these changes will serve to accurately position ICAO and all aviation stakeholders to prepare a proper response.

Coming out of this crisis requires solidarity and deliberate attention to harmonized and flexible solutions for an expedited restart and recovery. The TOGD and ICAO *Testing and Cross-Border Risk Management Measures Manual* are “living” documents intended to be updated in accordance with the ever-evolving epidemiological situation. ICAO will make these updates on an ongoing basis and as appropriate, taking into account medical advancements (such as vaccines) and feedback from Member States in cooperation with international and regional organizations and industry. ICAO will continue to monitor and assess the evolving situation until it stabilizes, and will coordinate actions to lay a foundation for building resilience in the long run.

⁷ <https://www.icao.int/secretariat/TechnicalCooperation/Pages/iPACK.aspx>

ANNEX

An international approach based on globally- and regionally-recognized and mutually-accepted measures is the core element and a prerequisite for a sustainable restart and recovery of aviation. In support of this approach, ICAO has developed multiple guidance, tools and other instruments to provide States with a clear overview of activities at their disposition and how these can be leveraged for maximum benefit. It is important to bear in mind that these materials change regularly to reflect the latest developments of the COVID-19 crisis and it is therefore advised to visit the following links regularly for most up-to-date and accurate information.

Posters in staff rest areas	A-43

1. Background

1.1 The impact of the coronavirus disease (COVID-19) pandemic on global air transport is without precedent. Airports have seen a 28.4 per cent decline in global passenger traffic volumes for the first quarter of 2020, equivalent to a reduction of 612 million passengers in absolute terms. For airlines, the revenue passenger kilometres flown (RPKs) worldwide were down by 94% on the previous year. International RPKs were down 98%, as the passenger side of the industry was virtually grounded. With second waves of the virus impacting various countries and leading to renewed travel restrictions, international air travel remains minimal at -88% down on last year in August. These volumes (domestic and international traffic) are expected to decrease by 50.4 per cent for 2020 as a whole as compared to 2019 figures¹. ICAO estimates that, by the end of 2020, the COVID-19 impact on scheduled international passenger traffic could reach reductions of up to 71 per cent of seat capacity and up to 1.5 billion passengers globally². Airlines and airports face a potential loss of revenue of up to 314 billion³ USD and 100 billion USD, respectively, for 2020.

2. Overview

2.1 This document provides a framework for addressing the impact of the current COVID-19 pandemic on the global aviation transportation system. The appendix to this document includes mitigation measures needed to reduce public health risk to air passengers and aviation workers while strengthening confidence among the travelling public, aviation workers, the global supply chain and governments. This will assist in accelerating demand for essential and non-essential air travel impacted by COVID-19. Complementing this material, this document also points to guidance material developed by international industry organizations which aims to assist in mitigating the impact of COVID-19.

2.2 With help and guidance from the civil aviation stakeholder community, ICAO recommends a phased approach to enable the safe return to high-volume domestic and international air travel for passengers and cargo. The approach introduces a core set of measures to form a baseline aviation health safety protocol to protect air passengers and aviation workers from COVID-19. These measures will enable the growth of global aviation as it recovers from the current pandemic. It is, however, important to recognize that each stage of that recovery will need a recalibration of these measures in support of the common objectives, which are to safely enable air travel, incorporate new public health measures into the aviation system, as well as support economic recovery and growth. Our work must recognize the need to reduce public health risk while being sensitive to what is operationally feasible for airlines, airports and other aviation interests. This is essential to facilitate the recovery during each of the forthcoming stages.

3. Objectives

3.1 In the aftermath of the COVID-19 outbreak, States, including government regulators, airports, airlines and aircraft manufacturers among other stakeholders of the aviation ecosystem, developed, in coordination with public health authorities, a set of measures aimed at reducing health risks to air travellers, aviation workers and the general public. These measures, applicable to States, airport operators, airlines and others in the air transport industry, are designed to enable a consistent and predictable travel experience. They will also contribute to the efficient, safe, secure and sustainable transport by air of an increasing number of passengers and cargo, and will minimize the risk of COVID-19 transmission between and among these groups and the general public. The implementation of these measures will facilitate and strengthen the global recovery from the COVID-19 pandemic.

1. [ACI Economic impact assessment of COVID-19 on the airport business](#) (May release)

2. [ICAO Economic Impact Analysis](#)

3. [IATA Economics Fourth Impact Assessment](#) (April release)

4. Guiding considerations

4.1 In developing the measures contained in the appendix, the drafters were guided by the following considerations:

- a) **Remain focused on fundamentals: safety, security, and efficiency;**
- b) **Promote public health and confidence among passengers, aviation workers, and the general public; and**
- c) **Recognize aviation as a driver of economic recovery.**

4.2 Based on these guiding considerations, the drafters further agreed that these measures should be:

- implemented in a multi-layer approach commensurate to the risk level and shall not compromise aviation safety and security;
- able to capitalize on the sector's longstanding experience and apply the same principles used for safety and security risk management. This includes monitoring compliance, reviewing the effectiveness of measures at regular intervals, and adapting measures to changing needs as well as improved methods and technologies;
- able to minimize negative operational and efficiency impacts while strengthening and promoting public confidence and aviation public health;
- consistent and harmonized to the greatest extent appropriate, yet flexible enough to respond to regional or situational risk-assessment and risk-tolerance. The acceptance of equivalent measures based on shared principles and internationally recognized criteria will be a fundamental enabler to restore air services on a global level;
- supported by medical evidence and consistent with health best practices;
- non-discriminatory, evidence-based and transparent;
- cost effective, proportionate and not undermining to the equal opportunity to compete;
- highly visible and communicated effectively and clearly to the aviation community as well as the general public; and
- consistent with State obligations under the Chicago Convention and other international treaties and agreements, as well as with standards and recommended practices applicable to aviation and public health.

5. Risk-based stages for mitigation measures

5.1 Resumption of higher volumes of passenger air travel will be dependent on a number of factors, including foremost public health agency guidelines (driven by travel risk levels), governmental travel restrictions and requirements, passenger confidence, and air carrier and airport operational capacity.

5.2 A risk-based approach will enable the transition between stages of restarting operations and the adjustment of mitigation measures based on risk, while recognizing that reverting to previous stages may be necessary. The goal is to maximize consistency and develop criteria for data reporting and the monitoring processes in support of evaluation and progression to the next stage(s). It is currently not feasible to provide any specificity of timing between these stages. At the time this document was published, most of commercial passenger aviation was in Stage 0 or 1.

- **Stage 0:** A situation with travel restrictions and only minimal movement of passengers between major domestic and international airports.
- **Stage 1:** Initial increase of passenger travel. This initial stage will coincide with relatively low passenger volumes, allowing airlines and airports to introduce aviation public health practices appropriate to the volume. There will be significant challenges as each stakeholder community adapts to both increased demand and the new operational challenges associated with risk mitigation. Health measures for travel required at airports will need to, at a minimum, match those from other local modes of transport and infrastructure.
- **Stage 2:** As health authorities review the applicability of measures based on recognized medical criteria, passenger volumes will continue to increase. Several measures that were required in Stages 0 and 1 may be lifted. Health measures for travel required at airports will need to match those from other local modes of transport and infrastructure.
- **Stage 3:** This stage may occur when the virus outbreak has been sufficiently contained in a critical mass of major destinations worldwide as determined by health authorities. The reduction of national health alert levels and associated loosening of travel restrictions will be key triggers. Risk mitigation measures will continue to be reduced, modified, or will be stopped in this stage. There may not be effective pharmaceutical interventions (e.g. therapies or vaccines) commonly available during Stage 3, but contact tracing and testing should be readily available. Until specific and effective pharmaceutical interventions are available, States may need to continue to loosen or reinstate public health and social measures throughout the pandemic.
- **Stage 4:** This stage begins when specific and effective pharmaceutical interventions are readily available in most countries. There may be a set of residual measures/mitigations that could be retained, although these should also undergo a periodic review process.

Note.— There are no hard boundaries in these stages and the transition between them can be in either direction.

Take-off: Guidance for Air Travel through the COVID-19 Public Health Crisis

Appendix

1. PUBLIC HEALTH RISK MITIGATION MEASURES

1.1 General

1.1.1 These public health risk mitigation measures are divided into four sections. The first section contains generally applicable risk mitigation measures that apply in all phases of air passenger and cargo transport. The second section describes modules, attached to this appendix, that are specific to various aspects of commercial air transport. The third section provides links to material, developed by industry organizations, to assist other aviation sectors. The final section describes Public Health Corridors as one collaborative implementation strategy for States to minimise the transmission of COVID-19 by aviation.

1.1.2 In the implementation of these measures, care should be taken to follow all applicable laws, regulations, requirements, standards and guidance issued by relevant sub-national, national and international authorities. Nothing in these guidelines is intended to supersede or contradict such requirements. States should ensure their policies and measures are coordinated across all relevant sectors.

1.2 Generally applicable risk mitigation measures

- **Public education:** States and stakeholders must work together to distribute accurate information quickly. Information must be as clear, simple and consistent as possible across the entire passenger travel experience.
- **General hygiene:** Hand hygiene (washing hands with soap and water or, where this is not available, using alcohol-based hand-sanitising solution), respiratory etiquette (covering the mouth and nose when sneezing or coughing) and limiting direct contact with any surfaces at the airport and in the aircraft to only when absolutely necessary should be observed at all times unless otherwise advised by airport staff or aircrew members.
- **Physical distancing:** To the extent feasible, people should be able to maintain social distancing consistent with World Health Organization (WHO) or applicable State health guidelines. Where this distancing is not feasible (for example in aircraft cabins), adequate risk-based measures should be used including allowing limited baggage in the cabin, orderly boarding processes, disembarkation announcements and procedures, and limiting unnecessary movement of passengers and cabin crew on board.

- **Face Coverings and Medical masks.** Face coverings⁴ and medical masks⁵ should be worn consistent with the applicable public health guidelines, including whom to exempt (e.g. young children or passengers that cannot tolerate a face covering or medical mask such as individuals with physical disabilities, respiratory or other conditions). Always follow best practice about when and how to wear, remove, replace, and dispose of face coverings and medical masks in addition to proper hand hygiene following removal. Face coverings should be two or more layers and fully cover the nose and mouth. The face covering or medical mask should be worn during all phases of flight except while eating. It should be replaced when it is no longer functional (e.g. becomes wet). Medical masks should be prioritized for use as personal protective equipment by healthcare workers, passengers at high risk of developing complications due to COVID-19, and symptomatic persons suspected of being infected with COVID-19. Face coverings and medical masks with exhalation valves can transmit the virus and should not be used. Refer to WHO⁶ and the attached posters for more guidance.
- **Routine sanitation:** High touch surfaces should be cleaned and disinfected as prescribed by public health authorities with frequency based on operational risk assessment.
- **Health screening:** States should ensure that health screening, at exit or entry, is conducted in accordance with the protocols of the relevant health authorities. Screening could consist of pre-flight and post-flight health declarations, non-invasive temperature measurement and/or visual observation conducted by employees trained to recognise signs suggestive of COVID-19 and in the use of these measures. Such screenings could identify ill persons that may require additional examination prior to working or flying. The availability of such information and insights can be leveraged in a risk-based approach, which will further contribute to reassure the travelling public. This screening may be conducted upon entry and/or exit. Temperature and other symptom-based screening could be a part of a multi-layered approach but should not be relied on as a stand-alone mitigation measure as it has limited effectiveness⁷ in detecting COVID-19 cases. The virus can be associated with mild symptoms or asymptomatic infections and is transmitted from both pre-symptomatic or asymptomatic individuals.

If a person shows signs and symptoms suggestive of COVID-19, or their declaration form shows a history of respiratory infection or/and exposure to high-risk contacts, appropriate follow up would be necessary, including a focused health assessment performed by healthcare personnel either in a dedicated interview space at an airport, or in an offsite pre-identified health care facility.

- **Health monitoring and Contact Tracing:** Methods for the collection of passenger and employee contact information valid for the destination should be in place, including through web applications. Such information is critical for health observation of incoming travellers, and would also be used to support public health authorities in contact tracing should this be warranted following the identification of a COVID-19 case. Updated contact information should be requested as part of the above mentioned declaration. Public Health Passenger Locator Form (PLF) should be distributed during flight and collected afterwards and handed over to relevant health authorities.⁸
- **Health declarations:** Where feasible and justified, health declaration forms or health attestations for COVID-19 should be used for all passengers, in line with the recommendations of relevant health authorities. Self-declarations in electronic format prior to airport arrival should also be encouraged to avoid crowding at airports. Refer to Public health corridor (PHC) Form 4.

⁴ Face coverings refer to non-medical masks made from a variety of fabrics and excludes professional medical masks. Note that industrial N95 masks are considered to be non-medical masks.

⁵ Medical masks refer to professional medical masks worn by healthcare workers - also referred to as surgical masks or medical N95 respirators.

⁶ www.who.int/emergencies/diseases/novel-coronavirus-2019/advice-for-public/when-and-how-to-use-masks

⁷ <https://www.who.int/news-room/articles-detail/public-health-considerations-while-resuming-international-travel>

⁸ State Letter 20/97

- **Passengers with reduced mobility:** The specific needs of passengers with reduced mobility should be considered when implementing these measures in order not to unnecessarily limit their access to air travel.
- **Risk management (including testing):** A range of different and varied mitigation measures are available to States to manage the risks posed to their populations and economies by COVID-19. States should assess their risks and determine mitigation measures appropriate to their situation. As new COVID-19 tests are developed and matured, and as testing capacity and availability improve, States may consider incorporating testing as part of an overall risk management strategy. While testing is not universally recommended by public health authorities, it has been implemented by some States as a routine health screening method for international travellers. ICAO has published a *Testing and Cross-Border Risk Management Measures Manual*⁹ to help States assess and develop their overall risk management strategy, including the possible use of testing. The Manual will be regularly updated to reflect medical advances and increased understanding of the disease.
- **Promoting, maintaining and supporting mental well-being:** COVID-19 and its associated restrictions has had a significant impact on the mental health and well-being of both passengers and aviation workers, which could impact operational safety. To provide for a psycho-socially safe and supportive aviation environment, multi-sector multi-stakeholder collaboration is necessary to support mental well-being of aviation workers, and to assist passengers in their preparations for travel. Principles and guidance material to support mental well-being may be found on the [Promoting, Maintaining and Supporting Mental Well-Being in Aviation during the COVID-19 Pandemic Electronic Bulletin \(EB 2020/55\)](#).

1.3 Risk mitigation measures applicable in specific modules

A. Airport

The airport module contains specific guidance addressing elements for airport terminal building, cleaning, disinfecting, hygiene, physical distancing, staff protection, access, check-in area, security screening, airside areas, gate installations, passenger transfer, disembarking, baggage claim and arrivals areas.

B. Aircraft

The aircraft module contains specific guidance addressing boarding processes, seat assignment processes, baggage, interaction on board, environmental control systems, food and beverage service, lavatory access, crew protection, management of sick passengers or crew members, and cleaning and disinfection of the flight deck, cabin and cargo compartment.

C. Crew

In order to promote safe and sustainable international air travel, a closely coordinated international approach to the treatment of air crews, consistent with recognized public health standards, will be essential to alleviate burdens on critical transportation workers. These currently include screening, quarantine requirements, and immigration restrictions that apply to other travellers. The crew module contains specific guidance addressing the contact of a crew member with a suspected or positive COVID-19 case, reporting for duty, dedicated end-to-end crew layover best practices, crew members experiencing COVID-19 symptoms during layover and positioning of crew.

⁹ LINK to the *Testing and Cross-Border Risk Management Measures Manual* will be included here.

D. Cargo

Cargo flight crews should apply the same health and safety considerations as passenger flight crews and are collectively included in the crew section of this document. Whilst air cargo consignments do not come into contact with the travelling public, the cargo acceptance and handover process does include interaction with non-airport employees. The cargo module addresses aviation public health including physical distancing, personal sanitation, protective barriers for points of transfer to the ramp and the loading and unloading, and other mitigation procedures.

1.4 Risk mitigation measures applicable to other aviation sectors

1.4.1 The Take-off Guidance Document was developed in collaboration with aviation industry organizations. Several of these organizations have developed additional guidance pertinent to the operations of their members. This material has been developed, and is being maintained, in line with the Key Principles set out in the CART Report and with the Guiding Considerations included in this Take-off Guidance Document.

1.4.2 The guidance material developed by CANSO to support the operational safety and efficiency of air traffic services provision may be found at [\[LINK¹⁰\]](#).

1.4.3 The guidance material developed by IBAC to support those business aviation operations that are not covered under the guidance for commercial air transportation may be found at [\[LINK¹¹\]](#).

1.4.4 The guidance material developed by IAOPA to support general aviation, including flying schools, recreational and non-commercial flying, may be found at [\[LINK¹²\]](#).

1.5 Implementation through Public Health Corridors

1.5.1 In order to mitigate the spread of COVID-19 and safeguard the health and safety of aviation personnel and passengers, States are strongly encouraged to collaborate with each other to establish Public Health Corridors.

1.5.2 A public health corridor is formed when two or more States agree to recognise the public health mitigation measures each has implemented on one or more routes between their States. To enable such mutual recognition, States are strongly encouraged to actively share information with other States by means of the PHC template on the CRRIC¹³.

1.5.3 In forming a public health corridor, it is anticipated that participating States would apply a mutually supportive multi-layered risk-based approach to their implementation of public health mitigating risk measures. A combination of risk controls will provide better protection than the implementation of only one or two selected risk controls. By collaborating on the measures implemented, States can establish a risk mitigation strategy that most effectively aligns to their risk tolerance and to their health and safety management systems.

1.5.4 To facilitate implementation of PHCs, the ICAO i-PACK “Establishing a Public Health Corridor¹⁴” is available to States. It includes associated procedures and relevant tools that will be regularly updated in view of latest scientific developments.

1.5.5 States are encouraged to establish key performance indicators to monitor the effectiveness of risk mitigation measures especially with respect to aviation recovery included in each module. These indicators should be developed from an aviation perspective and based on data released by public health authorities.

2. MODULES

<i>Module</i>	Airports
<i>Target audience</i>	
Airport operators, authorities, governments, airport staff.	

<i>Element</i>	Terminal building
<i>Brief description (Objective)</i>	
<p>Guidance for the operation of terminal buildings needs to consider all aspects of operations, including who has access to the building, the upkeep of cleanliness and disinfection procedures in place within the terminal building, as well as health measures, the provision of first-aid/medical attention guidance, and the protocols for passengers and staff.</p>	
<i>Considerations</i>	
<p>Cleaning and disinfection</p> <ul style="list-style-type: none"> • A written plan for enhanced cleaning and disinfection should be agreed upon by the airport health authority, airport operators and service providers, according to the standard operating procedures outlined in the WHO <i>Guide to Hygiene and Sanitation in Aviation</i>. The plan needs to be updated in terms of process, schedule and products, when new information becomes available. All relevant personnel should be trained on increased disinfection requirements. • Cleaning and disinfection of terminal infrastructure and all equipment should be done on a regular basis, in accordance with the aforementioned plan, and its frequency should be increased as needed based on traffic. • Increase the availability of cleaning and disinfecting products approved by the applicable authorities. • All cleaning and disinfection staff should be made aware of the cleaning and disinfection plan. It is necessary to ensure staff are utilizing products effectively, including the concentration, method and contact time of disinfectants, and addressing areas that are frequently touched and most likely to be contaminated, such as: <ul style="list-style-type: none"> ○ Airport information desks, passengers with reduced mobility (PRM) desks, check-in areas, immigration/customs areas, security screening areas, boarding areas, etc. ○ Escalators, elevators and lifts, handrails. ○ Washrooms, toilets and baby changing areas. ○ Luggage trolleys and collection points: cleaned with dispensable wet wipes or disinfectants, ensuring that disposal bins are made available. ○ Seats prior to security screening and in boarding/check-in areas. ○ Parking shuttle buses and airside buses. 	

- Increase the use of air conditioning and effective filtration systems to keep air clean, reduce re-circulation and increase the fresh-air ratio. Horizontal airflows should be limited.

Physical distancing

- Physical distancing is an effective measure to limit transmission of COVID-19 and should be part of a comprehensive package of measures to limit the spread of COVID-19. Physical distancing measures in airports should be:
 - At least consistent with what is applied for other transport modes, particularly in urban public transport used for access to and from airports.
 - Applied to the greatest extent possible throughout the airport.
 - Re-evaluated as epidemiological conditions permit.
- Physical distancing should target reaching at least one (1) metre between all individuals.
- Passengers should wear face coverings or medical masks in accordance with applicable health guidelines and where their use does not create shortages for healthcare workers
- Mutual recognition of equivalent physical distancing measures that mitigate the health risks at the point of departure and of arrival is encouraged.

Staff protection:

- The level of adequate protection for staff members should be evaluated on a case-by-case basis. Such protection may include personal protective equipment (PPE), health screening programmes for staff, scheduling (keeping groups of staff in steady teams and shifts), easy alcohol-based hand sanitizer access, specific staff process prior to and after completing a shift, and physical distancing plans for workstations, including the consideration of barriers.
- Employees should be equipped with PPE based on the risk of exposure (e.g. type of activity) and the transmission dynamics (e.g. droplet spread). PPE could include gloves, face coverings or medical masks, goggles or face shields, and gowns or aprons.
- For staff and teams working shifts, handovers should be conducted in a contact-free manner, i.e. via telephone, videoconference, electronic logs, or at least through physical distancing.
- Maintenance and repair work in public areas should be prioritized and their schedule adjusted or postponed if it is non-essential.
- Staff training should maximize the use of online training and virtual classrooms.
- The use of physical separators between selected staff and passengers is recommended in areas of repeated exchanges and transactions.

Airport terminal access

- According to each airport specificities and the national legislation in place, airport terminal access may be restricted to workers, passengers and persons accompanying passengers with disabilities, reduced mobility or unaccompanied minors in an initial phase, as long as it does not create crowds and queues, which would enhance risks of transmission as well as create a potential security vulnerability.
- Where health screening is required by applicable regulations, non-contact thermometers should be used in a designated area, under conditions which minimize the impact on operations.

Means for uniform implementation

- Collaborate with relevant authorities to ensure viewpoints are aligned.
- Collaborate with stakeholders in the community to ensure the timely and accurate dissemination of information to the travelling public.
- Ensure alignment of measures with other local modes of transport and other infrastructures.
- Use the Airport COVID-19 Cleaning / Disinfection Control Sheet (PHC Form 3) or a similar one where appropriate.

<p><i>Element</i></p> <p style="text-align: center;">General check-in area</p>
<p><i>Brief description (Objective)</i></p> <p>The general check-in area of an airport is usually an area that sees high passenger traffic. In order to limit queues and crowds, passengers should complete as much of the check-in process as possible before arriving at the airport (i.e. passengers should be ready to fly). Self-service options should be made available and utilized as much as possible to limit contact at passenger touchpoints.</p>
<p><i>Considerations</i></p> <ul style="list-style-type: none"> • Implement measures that reduce congestion within these areas through advanced-planning and monitoring of passenger flows. • Airports should provide signage, floor markings and announcements via public address (PA) systems to encourage physical distancing. In addition, support communication of key prevention messages from health authorities through audio messages and signs at key touchpoints of the passenger journey should be considered. • Various self-service tools, such as boarding pass and baggage tag kiosks and baggage drops are of specific concern due to the high levels of physical contact that increase the probability of contamination. Usage of these devices should nonetheless be encouraged to reduce face-to-face interactions, but with careful attention to the management of passenger flow and keeping such devices adequately and constantly disinfected. • Whenever possible, passengers should be encouraged to complete check-in processes prior to arriving at the airport. Online check-in, mobile boarding pass, off-airport baggage tagging, and other initiatives will contribute to the reduction in the amount of contact with airport staff and infrastructure. It is therefore recommended that States remove any regulatory obstacles to enabling such types of off-airport processes. • At the traditional check-in counters, the use of retractable stanchions and floor signage in the queuing area to encourage physical distancing and the installation of transparent barriers in front of staff at counters should be considered. • Self-sanitizing technology may also be considered for integration within kiosks with touch screens, to allow for the disinfection of the screens between each use. • Whenever possible, airport and other stakeholders should use contactless processes and technology, including contactless biometrics such as facial or iris recognition. Such digital identification processes can be applied to self-service bag drops, various queue accesses, boarding gates and retail and duty-free outlets. This will eliminate or greatly reduce the need for contact with travel documents between staff and passengers. It may also accelerate various processes, resulting in enhanced health protection, reduced queuing and other process efficiencies.
<p><i>Means for uniform implementation</i></p> <ul style="list-style-type: none"> • Collaborate with relevant authorities, airlines and other aviation stakeholders for cost-effective solutions that protect the public.

- Simplified formalities by enabling contactless processes.
- Greater use of standardized digital identity management solutions.
- Use the Airport COVID-19 Cleaning / Disinfection Control Sheet (PHC Form 3) or a similar one where appropriate.

<i>Element</i> <p style="text-align: center;">Security Screening</p>
<p><i>Brief description (Objective)</i></p> <p>In response to the continuing pandemic, we can expect the need for physical distancing measures to be maintained at security screening checkpoints, including during the screening process. Measures to control access to the security screening checkpoint may need to be considered, as well as possible modifications to standard screening, in order to comply with new COVID-19 sanitary guidelines.</p> <p>Security screening staff should be exempt from carrying out health and safety related screening to ensure they remain focused on security screening and related processes.</p>
<p><i>Considerations</i></p> <p>Checkpoint access procedures</p> <ul style="list-style-type: none"> • Appropriate procedures should be implemented in coordination with relevant government departments in order to respond to any passengers showing signs of illness. • Hand sanitizers and disinfection products should be provided prior to passengers and staff screening access points where possible. • Screeners and passengers should maintain physical distancing to the extent possible or wear the appropriate PPE to mitigate the risk of exposure. • Rearranging of security checkpoint accesses and layouts should be considered with the objective of reducing crowds and queues, to the extent possible, and maintaining physical distance while maintaining desirable throughput. This should include both divestment areas and those areas where passengers retrieve their screened cabin baggage. • Floor-markings, tensile barriers, or other suitable means should be established within the queueing area to help secure the proper distancing recommended by the appropriate authorities. • Procedures involving passengers presenting boarding passes and other travel documents to security personnel should be done, to the extent possible, while avoiding physical contact and in a way that minimizes face-to-face interaction. Should there be a need to identify a person wearing a face covering or medical mask against a government-issued photo identification, the face covering or medical mask could be removed temporarily if physical distancing measures are met. Appropriate signage should be deployed that clearly informs about subsequent steps of the process. <p>Possible solutions include:</p> <ul style="list-style-type: none"> ○ Directing passengers to use automatic boarding pass scanners at access points while maintaining appropriate physical distance. ○ Using mobile boarding pass scanners operated by the security staff. ○ Conducting a visual inspection of the boarding pass and relevant identification documentation, as needed by standard operating procedures. <ul style="list-style-type: none"> • Automated gates and mobile scanners' reader surfaces should be disinfected with the same frequency as for any other high-touch surface.

- Passenger preparation officers should be deployed to ensure passengers are prepared for the divestment needs. Screeners should reinforce processes with passengers accessing divesting areas, such that they properly divest and are less likely to cause a false alarm (to minimize the use of manual searches).
- Enhanced cleaning and disinfecting should be routinely conducted of frequently touched/exposed surfaces and security screening equipment, including trays at the security checkpoint and baggage areas.

Passenger Screening

- Alcohol-based hand sanitizer should be distributed to staff for the cleaning and disinfection of their hands.
- Screeners should wear gloves and face coverings or medical masks when conducting manual searches on passengers. Alcohol-based hand sanitizers should be applied to the gloves between each passenger screened. Gloves should be changed when they are obviously soiled or torn.
- Employees should be advised to wash their hands after removing gloves.
- Appropriate signage and information to passengers should be clearly displayed regarding newly implemented health requirements, as well as modified screening processes. Signage should highlight the need for passenger cooperation throughout the screening process.
- Whenever screening checkpoints are processing a high number of passengers, staff and crew screening should be performed in dedicated checkpoints and separately from passengers (as an additional preventive health measure), where possible.
- Appropriate alarm resolution arrangements should be put in place to mitigate the risk of queue build up and to maintain passenger throughput. These might include alarm resolution in a dedicated area separated from the flow of passengers which may need the positioning of additional security personnel.
- For WTMD alarm resolution, prioritize the use of hand-held metal detectors to identify the cause of alarm, followed by a targeted manual search where the alarm is.
- The use of explosive trace detection (ETD) equipment or explosives detection dogs (EDDs) should not be limited to alarm resolution. Random use of such explosive detection should be encouraged and leveraged where possible.
- Should there be a concern or an alarm that cannot be cleared solely by the primary screening equipment used, it should undergo a secondary screening using, in order of availability and subject to the nature of the screeners concern regarding the threat: EDD, ETD or manual search
- If the standard procedure allows for the reuse of ETD swabs, consideration should be given to discontinuing this practice to limit the possibility of spreading COVID-19.

Note.- The standard procedure may continue if, for example, it could be determined that the high temperature generated by the specific ETD in use will destroy the virus and if the process for handling and storage of swabs eliminates the possibility of contamination.

- If there is a need to conduct a manual search, screeners should adapt their methodology, if possible, to avoid being face-to-face with passengers or other persons being screened.
- Staff needed to interact with passengers in close proximity should use a face covering or medical mask.
- Larger quantities of health-related liquids, aerosols and gels (LAGs) than prescribed by applicable security regulations, such as alcohol-based hand disinfectants, could be accepted if permitted by the appropriate authorities for aviation security and safety, taking into account the related regulations¹⁵.

Means for uniform implementation

- Work with the regulator to consider alternatives to manual searches when conducting random searches. Such alternatives should only be implemented with the approval of the appropriate authority and based on a risk assessment.
- Work with relevant health authorities to ensure cleanliness and disinfection protocols are developed and implemented for items with a high likelihood of cross contamination (e.g., trays and divestment area).
- Use the *Airport COVID-19 Cleaning / Disinfection Control Sheet* (PHC Form 3) or a similar one where appropriate.

¹⁵ <https://www.icao.int/safety/COVID-19OPS/Pages/DangerousGoods.aspx>

<p><i>Element</i></p> <p style="text-align: center;">Terminal Airside Area</p>
<p><i>Brief description (Objective)</i></p> <p>The post-security terminal airside area is an area of high passenger traffic with few physical barriers and usually wide-open space. Consideration needs to be given to the temporary need for physical distancing, while also providing passengers with access to the retail, duty-free concessions and food and beverage offerings.</p> <p>Gate areas, VIP lounges and other services in this area also see a high passenger volume. Various flow monitoring tools, physical installations, floor markings and adapted wayfinding need to be evaluated and deployed. Enhanced cleaning and hygiene measures may need to be scheduled and deployed to contribute to the limiting of the virus spread.</p>
<p><i>Considerations</i></p> <ul style="list-style-type: none"> • Encourage the use of self-service options, established in compliance with local health authority guidelines where passengers have limited contact with retail, food and beverage staff. • An orderly boarding process will be necessary to reduce physical contact between passengers, especially once load-factors start increasing. Close cooperation between the airline, airport and government is vital. Airlines will need to revise their current boarding processes. Airports may need to assist in redesigning gate areas and governments may need to adapt applicable rules and regulations. The increased use of automation, such as self-scanning and biometrics should be facilitated. • Especially during the early stages of the restart phase, carry-on baggage that would need to use the overhead bins should be limited to facilitate a smooth boarding process. • Where possible, implementation of self-boarding technologies at the gate should be considered, including units using automatic doors, integrated boarding pass readers, LCD displays for passenger instructions and a device for printing seat assignment changes. • Increase use of all other opportunities of self-scanning of documents when identification is needed. • As a temporary measure, sitting areas (e.g., lounges, gates, restaurants) can open at limited capacity to accommodate the short-term need for physical distancing. As the recovery phase progresses and health requirements evolve, a return to regular capacity can be contemplated. • Temporary closing or enhanced monitoring of certain service areas should be considered, based on the stage of mitigation measures, such as: <ul style="list-style-type: none"> ○ Self-service buffet food; ○ Café seating or multi-purpose seating; ○ Smoking areas; and ○ Children’s play areas. • Multiple alcohol-based hand sanitizer stations should be made available throughout the airport with adequate signage for passengers.

- Installation of touch-free equipment in toilet facilities such as the following should be considered:
 - Automated door systems;
 - Automatic toilet flushing system;
 - Taps and soap/hand sanitizer dispensers; and
 - Automated hand towel dispensers.

Means for uniform implementation

- Work with retail, food and beverage concessions to ensure the use of contactless technology payment options and self-serve options.
- Involve airline stakeholders in measures needed in airport lounges.
- Collaborate with relevant authorities, airlines and other aviation stakeholders for cost-effective solutions that protect the public.
- Use the *Airport COVID-19 Cleaning / Disinfection Control Sheet* (PHC Form 3) or a similar one where appropriate.

<p><i>Element</i></p> <p style="text-align: center;">Aircraft Terminal Gate Equipment</p>
<p><i>Brief description (Objective)</i></p> <p>Many airports will have decommissioned certain assets in response to a lack of passenger traffic. Appropriate safety checks need to be conducted prior to the recovery of the airline traffic. Airports and airlines need to work together to ensure that accurate flight schedules are provided in order to meet this demand.</p>
<p><i>Considerations</i></p> <ul style="list-style-type: none"> • Electromechanical equipment such as boarding bridges, escalators and elevators must be inspected and periodically tested or started up. Inspections of such decommissioned equipment are essential before returning them to service for passenger use, based on manufacturers' recommendations and national building codes. • Maintenance protocols need to be defined and deployed. • Where conditioned air is needed, power should be maintained in all outdoor-based equipment such as jetways and pre-conditioned air units. • Critical service providers and State authorities must be advised in advance on ramp-up schedules and plans by the airport operator to return temporarily closed facilities into service. • Passenger bus capacity should be adapted to facilitate physical distancing during boarding and disembarking of passengers <p>Gate aircraft equipment and air filtering</p> <ul style="list-style-type: none"> • Where external pre-conditioned air (PCA) and fixed electrical ground power are available at the stand, an aircraft can switch off its auxiliary power unit (APU) after arrival. A PCA system takes in ambient air through an intake filter and provides conditioned air to the cabin. • External air sources are not processed through the aircraft's high-efficiency particulate air (HEPA) filter. The aircraft APU should be permitted to be used at the gate to enable the aircraft's air conditioning system to be operated if equivalent air quality from PCA is not available.
<p><i>Means for uniform implementation</i></p> <ul style="list-style-type: none"> • Ensure that airport capacity recommissioning is in step with airline schedules and phased in an appropriate manner.

<i>Element</i> Disembarking and Arrivals
<p data-bbox="155 296 493 323"><i>Brief description (Objective)</i></p> <p data-bbox="155 363 1390 390">Border control and customs processes may need to be temporarily revised to increase physical distancing.</p> <p data-bbox="155 430 1406 558">Where equipment already exists, the use of automated border control (ABC) equipment, digital passenger identification (biometrics) as well as technology (thermal screening) could serve as an additional health screening measure and could speed up the immigration process, with the objective of reducing queuing and minimizing contact between border officials and passengers.</p> <p data-bbox="155 598 1406 695">Furthermore, during initial stages, some governments are exploring the idea of a health declaration to be completed by passengers before departure or on arrival as an initial assessment measure, which could be used to identify passengers for secondary assessment.</p>
<p data-bbox="155 785 334 812"><i>Considerations</i></p> <ul data-bbox="204 840 1406 1619" style="list-style-type: none"> <li data-bbox="204 840 1406 936">• Coordination with various border regulatory authorities (e.g., immigration, health) should be established for measures facilitating the clearance of entry/arrival, such as enabling contactless processes (e.g., relating to the reading of passport chips, facial recognition). <li data-bbox="204 976 1406 1104">• Where declarations are needed on arrival, governments should consider electronic options (e.g., mobile applications and QR codes) to minimize human-to-human contact. Information could be sent in advance via government portals. For customs formalities, where possible, green/red lanes for self-declarations are recommended. <li data-bbox="204 1144 1406 1241">• The identity verification process should be automated with the use of biometric technology. Use of contactless technology, automated border control or eGates should be encouraged in order to enhance transaction time and limit interaction between passengers, officers and staff. <li data-bbox="204 1281 1406 1346">• If needed by relevant regulations, smart thermal cameras can be installed to scan the temperature of multiple passengers rapidly and unobtrusively. <li data-bbox="204 1386 1406 1451">• During initial stages of recovery and if needed, secondary health assessments could be set to maintain the main general flow of passengers. <li data-bbox="204 1491 1406 1619">• For flights arriving from higher-risk areas where there are cluster or community transmission, a particular section of the arrivals terminal could be utilized to increase physical distancing, and/or smart thermal cameras could be placed at appropriate locations to screen arriving passengers, in consultation with the public health authorities. <p data-bbox="155 1654 396 1682">Health Declaration</p> <ul data-bbox="204 1709 1406 1801" style="list-style-type: none"> <li data-bbox="204 1709 1406 1801">• Some governments are implementing a health declaration solution that can be set-up on a web portal. For those States that already have a platform to collect visa and electronic travel authorization information they could be customized to accommodate the additional information needed. <p data-bbox="155 1837 269 1864">Transfer</p> <ul data-bbox="204 1892 1406 1944" style="list-style-type: none"> <li data-bbox="204 1892 1406 1944">• Develop “one-stop” health screening arrangements using existing one-stop security arrangement as a model. In this model, passengers and property are not rescreened at transfer locations based on

mutual recognition of security measures between the States in the travel itinerary. A similar arrangement for health screening procedures may prevent new queuing points at passenger transfer locations.

- Where transfer security screening is needed, it should follow appropriate sanitary requirements as previously described in the departure process.

Means for uniform implementation

- Collaborate with relevant authorities for cost-effective solutions that protect the public.
- Collaborate with relevant authorities and airlines to develop efficient and cost-effective solutions that protect the travelling public.
- Work with governments and authorities if a health declaration is to be implemented.
- Greater use of standardized digital identity management solutions.
- Use the *Airport COVID-19 Cleaning / Disinfection Control Sheet* (PHC Form 3) or a similar one where appropriate.

<i>Element</i> Baggage Claim Area
<p><i>Brief description (Objective)</i></p> <p>The baggage claim area of an airport is susceptible to high passenger footfall and physical contact with luggage carts, baggage, washrooms and other facilities. Disinfection measures and increased frequency of cleaning should be implemented.</p>
<p><i>Considerations</i></p> <ul style="list-style-type: none"> • All efforts need to be made to provide a speedy baggage claim process and ensure that passengers are not made to wait for excessive amounts of time in the baggage claim area. • Maximize use of available arrival baggage carousels to limit the gathering of passengers, and, where possible, use of dedicated baggage carousels for flights from high risk areas. • Governments should ensure that the customs clearance process is as speedy as possible and that appropriate measures are taken in case of physical baggage inspections. • Cleaning schedules should be aligned based on flight schedules to ensure a more frequent, in-depth disinfection of luggage carts, washrooms, elevator buttons, rails, etc. • Self-service kiosks or online options for passengers needing to report lost or damaged luggage should be made available. • Floor-markings, tensile barriers, or other suitable means should be established to help secure the proper distancing recommended by the appropriate authorities. • Airline agents at lost luggage counters should be provided with physical barriers (transparent) when possible. • The use of baggage delivery services, where the passenger's baggage can be delivered directly to their hotel or home, should be encouraged. • Baggage tracking information should be shared with passengers so that they are able to make a baggage claim, in case of baggage mishandling, without waiting in the reclaim area. • Protocols for cleaning and disinfection of the area should be established.
<p><i>Means for uniform implementation</i></p> <ul style="list-style-type: none"> • Collaborate with relevant authorities and airlines for cost-effective solutions that protect the travelling public. • Use the <i>Airport COVID-19 Cleaning / Disinfection Control Sheet</i> (PHC Form 3) or a similar one where appropriate.

<p><i>Element</i></p> <p style="text-align: center;">Exit the Landside Area</p>
<p><i>Brief description (Objective)</i></p> <p>Protocols and precautions need to be in place for arriving passengers who are exiting the landside area. Consideration should be given to the greeter's area as well as the terminal's exit area. During initial restart phases, measures could include establishing a perimeter around the greeter's area or limiting access to the terminal building.</p>
<p><i>Considerations</i></p> <p>Airport terminal access</p> <ul style="list-style-type: none"> • According to each airport's specificities and the national legislation in place, airport terminal access may be restricted to workers, passengers and persons accompanying passengers with disabilities, reduced mobility or unaccompanied minors in an initial phase, as long as it does not create crowds and queues which would then increase risks of transmission as well as create a potential security vulnerability. • Multiple hand washing stations or hand sanitizers should be provided prior to the exit of the terminal building. • Cleaning should be increased based on flight schedules to ensure a more frequent, in-depth disinfection of landside public areas, including seating areas, food and beverage and retail, handrails, washrooms, automated moving systems and buses.
<p><i>Means for uniform implementation</i></p> <ul style="list-style-type: none"> • Collaborate with stakeholders in the community to ensure the timely, accurate dissemination of information to the travelling public. • Use the <i>Airport COVID-19 Cleaning / Disinfection Control Sheet</i> (PHC Form 3) or a similar one where appropriate.

<i>Module</i>	Aircraft
<i>Target audience</i>	
Operators covered under Annex 6 – <i>Operation of Aircraft, Part 1 – International Commercial Air Transport – Aeroplanes.</i>	

<i>Element</i>	Passenger and Crew – General
<i>Brief description (Objective)</i>	
Provide a safe, sanitary operating environment for passengers and crew.	
<i>Considerations</i>	
<ul style="list-style-type: none"> • Adjust the boarding process. To the extent possible, and consistent with weight and balance considerations, the boarding and disembarking of passengers should be conducted in ways that reduce the likelihood of passengers passing in close proximity to each other. • Seat assignment processes. When needed, seats should be assigned for adequate physical distancing between passengers. Airlines should allow for separated seating arrangements when occupancy allows it. Passengers should also be encouraged to stay in the assigned seat as much as possible. • Limit interaction on board. Passengers should be encouraged to travel as lightly as possible with all luggage checked-in except small hand luggage that fit under the seat. Newspapers and magazines should be removed. The size and quantity of duty-free sales may also be temporarily limited. • Limit or suspend food and beverage service. Food and beverage service should be limited or suspended on short-haul flights or should be considered to be dispensed in sealed, pre-packaged containers. • The use of non-essential in-flight supplies, such as blankets and pillows, should be reduced to minimize the risk of cross infection. • Restrict lavatory access. When possible, one lavatory should be designated for crew use only, provided sufficient lavatories remain available for passenger use without fostering congregation by passengers waiting to use a lavatory. Passengers should be informed that closing the lavatory lid before flushing is an effective method to mitigate the spreading of potentially infectious particles. • Also, to the extent practicable depending on the aircraft, passengers should use a designated lavatory based on seat assignment to limit passenger movement in flight, which reduces exposure to other passengers. • Crew protection measures. Sharing of safety equipment used for safety demonstrations should be prohibited. Crew members should be instructed to provide service only to specific sections of the cabin. Additional means of protection, for instance plastic curtains or Plexiglas panels during the boarding process (to be removed once boarding is completed), should be explored. 	

Note.- The following elements concerning disinfection contain the latest joint aircraft original equipment manufacturer (OEM) recommendations currently available. Users of this guidance should note that:

- *These recommendations are based on evolving circumstances and technology.*
- *While every attempt was made to provide common recommendations for disinfectants usage on aeroplanes, there are differences between the products manufactured by each aircraft OEM. It is strongly recommended that the operator is familiar with OEM guidance and consults the OEM for any questions specific to that airframe.*
- *The intent of these guidelines is to provide operators with recommendations that are aligned with the aircraft product. It is the responsibility of the operator to ensure that the disinfectants are used per the manufacturer's instructions, that proper protection is employed by those using the disinfectant and that their use is in alignment with health organizations' recommendations for efficacy and in accordance with the label instructions of the disinfectant.*

<i>Element</i>	Disinfection – Flight Deck
<i>Brief description (Objective)</i>	Provide a safe, sanitary operating environment for crew and ground staff.
<i>Considerations</i>	<ul style="list-style-type: none"> • Frequency of cleaning of the flight deck should account for the separation of the flight deck from the passenger compartment as well as for the frequency of crew transitions. • The flight deck should be cleaned and disinfected at an appropriate frequency to accommodate safe operations for the crew. • Disinfection methods should be adopted in consultation with the aircraft manufacturer and based on an appropriate safety risk assessment. Any advice from WHO should also be taken into account. The risk assessment should be informed by recommendations from airframe manufacturers and reference instructions from appropriate health organizations on application to be effective against viruses. • Aircraft manufacturers recommend: <ul style="list-style-type: none"> ○ the use of a 70% aqueous solution of Isopropyl Alcohol (IPA) as a disinfectant for the flight deck touch surfaces with specific care to be taken for application on leather and other porous surfaces; ○ periodic equipment inspection to detect long-term effects or damage given the lack of data on the long term effects of much more frequent application of disinfectants; and to contacting them for guidance on alternate disinfectants should damage be observed; ○ considering enhanced inspection intervals or maintenance when employing aggressive or new disinfection techniques. ○ following their instructions for ensuring proper application, ventilation and use of personal protection equipment; and ○ consulting them for more detailed recommendations or additional disinfecting chemicals noting the discrepancy in approvals for disinfection products in different States and in their availability. • Surfaces should be cleaned of dirt and debris per instructions from the aircraft. • Application to surfaces should be with pre-moistened wipes or single use wetted cloth and use limited bottle sizes on board to minimize the risk of spilling the IPA solution. Do not spray IPA in the flight deck. Do not allow the liquid to pool or drip into the equipment. • IPA is flammable, so precautions should be taken around potential sources of ignition. • The operator should consider whether increased cleaning and disinfection may affect compliance with any applicable disinsection requirements established in accordance with ICAO Annex 9. Additional information can be obtained from the appropriate authority and technical guidance is available on the WHO publication on aircraft disinsection methods and procedures¹⁶.

¹⁶ <https://www.who.int/publications/i/item/cleaning-and-disinfection-of-environmental-surfaces-inthe-context-of-covid-19>

- UV irradiation does not replace normal manual cleaning procedures but could be used to supplement existing disinfection procedures. Where used, several important factors should be considered, including that UV disinfection is only effective if the virus is exposed to the UV light. Materials that are exposed to UV light may be damaged or discoloured. The Airframe OEM should be consulted to ensure that the device intended for use is compatible with aircraft materials.
- Given the increased likelihood that switch positions may be inadvertently changed during the cleaning or disinfection process, operators and flight crew should reinforce procedures to verify that all flight deck switches and controls are in the correct position prior to operation of the airplane.
- Some equipment on the flight deck may have additional disinfectant needs based on usage (e.g., oxygen masks) and procedures should be put in place accordingly.

Means for uniform implementation

- OEM communication through ICCAIA and OEM communication with operators.
- Use the *Aircraft COVID-19 Disinfection Control Sheet* (PHC Form 2) or a similar one when appropriate.

<i>Element</i> Disinfection – Passenger Cabin
<i>Brief description (Objective)</i> Provide a safe, sanitary operating environment for passengers, crew and ground staff.
<i>Considerations</i> <ul style="list-style-type: none"> • The cabin should be cleaned and then disinfected at an appropriate frequency to accommodate safe operations for the passengers and crew. The frequency should account for the operation of the aircraft and the potential exposure of the cabin to an infected person. • Disinfection methods should be adopted in consultation with the aircraft manufacturer and based on an appropriate safety risk assessment. Any advice from WHO should also be taken into account. The risk assessment should be informed by recommendations from airframe manufacturers and reference instructions from appropriate health organizations on application to be effective against viruses. • Aircraft manufacturers recommend: <ul style="list-style-type: none"> ○ the use of a 70% aqueous solution of Isopropyl Alcohol (IPA) as a disinfectant for cabin high-touch surfaces with specific care to be taken for application on leather and other porous surfaces; ○ periodic equipment inspection to detect long-term effects or damage given the lack of data on the long term effects of much more frequent application of disinfectants; and to contacting them for guidance on alternate disinfectants should damage be observed; ○ following their instructions for ensuring proper application, ventilation and use of personal protection equipment; ○ considering enhanced inspection intervals or maintenance when employing aggressive or new disinfection techniques. ○ consulting them for more detailed recommendations or additional disinfecting chemicals noting the discrepancy in approvals for disinfection products in different States and in their availability. • Surfaces should be cleaned of dirt and debris before disinfecting to maximize effectiveness. • Application to surfaces should be with pre-moistened wipes or single use wetted cloth and use limited bottle sizes on board to minimize the risk of spilling the IPA solution. Do not spray IPA in the cabin. Do not allow the liquid to pool or drip into equipment (e.g., in-flight entertainment electronic boxes). • IPA is flammable, so precautions should be taken around potential sources of ignition. • The operator should consider whether increased cleaning and disinfection may affect compliance with any applicable disinsection requirements established in accordance with ICAO Annex 9. Additional information can be obtained from the appropriate authority and technical guidance is available on the WHO publication on aircraft disinsection methods and procedures¹⁷.

<p><i>Element</i></p> <p style="text-align: center;">Disinfection – Maintenance</p>
<p><i>Brief description (Objective)</i></p> <p>Provide a safe, sanitary operating environment for passengers, crew and ground staff.</p>
<p><i>Considerations</i></p> <ul style="list-style-type: none"> • Airlines should be mindful of regular maintenance to both air systems and water systems to ensure they continue to protect the passenger and crew from viruses. Airlines should refer to the Airframe OEM for specific maintenance actions and intervals. • Airlines should include access panels and other maintenance areas in their disinfection procedures to ensure a safe environment for the maintenance crews. • Airlines may wish to review their operating procedures to minimize the number of personnel who need to be in contact with high-touch surfaces such as access panels, door handles, switches, etc. • Airlines should establish maintenance procedures to be applied after disinfection procedures in order to check the Flight Deck, Passenger Cabin and Cargo Compartment for the correct positioning of control handle, circuit breakers and control panels’ switches and knobs. Access panels and doors’ closure also should be checked.
<p><i>Means for uniform implementation</i></p> <ul style="list-style-type: none"> • OEM communication through ICCAIA and OEM communication with airlines. • Use the <i>Aircraft COVID-19 Disinfection Control Sheet</i> (PHC Form 2) or a similar one when appropriate.

<p><i>Element</i></p> <p style="text-align: center;">Hazardous Waste</p>
<p><i>Brief description (Objective)</i></p> <p>Hazardous Waste Management</p>
<p><i>Considerations</i></p> <ul style="list-style-type: none"> • Normal waste: Cabin wastes generated during flight operations where no passenger or crew member exhibits COVID-19 symptoms should be handled as normal waste, as recommended by WHO, and disposed of in line with the procedures for such waste applicable in the State of destination. <p><i>Note.- This includes face coverings and medical masks. Only face coverings and medical masks that have been used by a person who exhibited symptoms of COVID-19 or visibly soaked with blood or body fluids should be treated as biohazardous waste.</i></p> <ul style="list-style-type: none"> • Biohazardous waste: If a passenger or crew member exhibits COVID-19 symptoms, all waste materials including partly-consumed meals, beverages and disposable items as well as used paper towels, tissues and PPE (including face coverings and medical masks), generated whilst treating or supporting the passenger or crew member should be treated as potentially a biohazardous waste. • Biohazardous waste should be placed in the biohazard waste disposal bag in the aircraft's UPK or double bagged in standard plastic waste bag. In accordance with WHO and other relevant guidelines the spraying or sprinkling of disinfectant into the contents of the biohazardous waste bags is not necessary to reduce the spread of COVID-19. The action of spraying chemical disinfectant may result in virus particles of becoming airborne, presenting an additional risk to passengers and crew. The bags should be labelled and sealed. The airport authority and aircraft service providers must be informed of the presence of potentially biohazardous waste. • States should consider relieving the ban on single use plastics to permit their use by airports and civil aviation authorities for medical, hygiene and safety purposes during the pandemic. • Airlines should prepare a written plan to share with stakeholders regarding their COVID-19 waste management procedures and communicate the information accordingly. Crew should be trained in the handling of potentially biohazardous waste. • Airports and/or the relevant waste handling stakeholders should identify potential options for the treatment and disposal of potentially biohazardous cabin waste resulting from the pandemic and communicate the information accordingly. The relevant personnel should be trained in the handling of potentially biohazardous waste.
<p><i>Means for uniform implementation</i></p> <ul style="list-style-type: none"> • OEM communication through ICCAIA and OEM communication with airlines.

Element

Air System Operations

Brief description (Objective)

The aircraft manufacturers recommend maximizing total cabin airflow and care should be taken to avoid blocking air vents (particularly along the floor). These are general recommendations for cabin air considerations and there may be exceptions for specific aircraft models. It is strongly recommended that operators consult with the aircraft OEM for questions specific to an aircraft type.

*Considerations***Ground Operations (before chocks-off and after chocks-on)**

- Operations without the air conditioning packs or external pre-conditioned air (PCA) source should be avoided. External air sources are not processed through a high-efficiency particulate air (HEPA) filter. Use of the aircraft APU should be permitted at the gate to enable the aircraft's air conditioning system to be operated, if equivalent filtration from PCA is not available.
- If the aircraft has an air recirculation system, but does not have HEPA filters installed, reference should be made to OEM published documents or the OEM should be contacted to determine the recirculation system setting.
- It is recommended that fresh air and recirculation systems be operated to exchange the volume of cabin air before boarding considering the following:
 - For aircraft with air conditioning, run the air conditioning packs (with bleed air provided by APU or engines) or supply air via external PCA source at least 10 minutes prior to the boarding process, throughout boarding and during disembarkation.
 - For aircraft with HEPA filters, run the recirculation system to maximize flow through the filters.
 - For aircraft without an air conditioning system, keep aircraft doors open during turnaround time to facilitate cabin air exchange (passengers' door, service door and cargo door).

Flight Operations

- Operate environmental control systems with all Packs in AUTO and recirculation fans on.
 - Valid only if HEPA recirculation air filters are confirmed to be installed.
- If non-HEPA filters are installed, contact the aircraft OEM for recommendations on recirculation settings.
- If the aircraft in-flight operating procedure calls for packs to be off for take-off, the packs should be switched back on as soon as thrust performance allows.

Minimum Equipment List (MEL) Dispatch:

- Fully operational air conditioning packs and recirculation fans provide the best overall cabin ventilation performance. It is recommended to minimize dispatch with packs inoperative. It is recommended to minimize dispatch with recirculation fans inoperative for aircraft equipped with HEPA filter.

- Some aircraft have better airflow performance with all outflow valves operational. The OEM should be contacted about ventilation performance of the aircraft with outflow valves inoperative and the limitations associated with the dispatch in this situation.

High Flow (max Bleed) Switch:

- If the aircraft has an option for high flow operation, contact the OEM for setting recommendations.

For example:

Boeing recommends that airlines select High Flow Mode for 747-8, MD-80 and MD-90 aircraft, as this will maximize total ventilation rate in the cabin.

Note 1.- This will increase fuel burn. However, for the 747-400 and 737, High Flow Mode should NOT be selected as this does not result in an increase in total ventilation rate. For all models, recirculation fans should remain on (when HEPA filters are installed).

Note 2.- Sick passenger positioning guidance is contained in Cabin Crew element of the Crew module.

Filter Maintenance:

- Follow normal maintenance procedures as specified by the OEM. Take note of special protection and handling of filters when changing them.
- Contact OEM or refer to OEM published document to check if an additional sanitization procedure and/or personnel health protection is needed to avoid microbiological contamination in the filter replacement area.

Means for uniform implementation

- OEM communication through International Coordinating Council of Aerospace Industries Associations (ICCAIA) and OEM communication with airlines.
- Use the *Aircraft COVID-19 Disinfection Control Sheet* (PHC Form 2) or a similar one when appropriate.

<i>Module</i>	Crew
<i>Target audience</i>	All operations covered under Annex 6 – <i>Operation of Aircraft, Part 1 – International Commercial Air Transport - Aeroplanes</i> , Civil Aviation Authorities and public health agencies.
<i>Element</i>	Crew Members
<i>Brief description (Objective)</i>	Provide harmonised health protection and sanitation considerations applicable to crew members that can be implemented globally.
<i>Considerations</i>	<p>General</p> <ul style="list-style-type: none"> Unless specified as flight crew or cabin crew, the term “crew” refers to all operational crew required on board for the air operator to support the flight. This element applies to all crew. <p>Facilitation</p> <ul style="list-style-type: none"> Crew members operating passenger aircraft with cargo only, for example, should ensure that the correct notification has been sent to all agencies, to ensure that there is no confusion, or that crew members carried on board such as loadmasters, engineers, and cabin crew are correctly recognised and designated on the crew manifest. Flight crew travel, including travel between States for training and medical certification purposes, is essential in re-establishing operations as alleviations to medical certification, training and checking requirements expire. Noting that many States do not have direct access to training facilities such as flight simulation training devices, it is essential to consider flight crew as ‘key workers’ to benefit from PHC initiatives when accessing such facilities or being required to undergo medical examinations in other States. Further details can be found in ICAO State letter AN 5/28 -20/97. States should require the airlines on their register to establish a coherent, effective and verifiable health assurance programme for their staff that would enable the implementation of measures that facilitate the continued operation of aircraft, such that: <ul style="list-style-type: none"> Quarantine measures are not imposed on crew who need to layover, or rest, for the purposes of complying with flight time limitation (FTL) rest requirements. Crews are not subject to screening or restrictions applicable to other travellers. Health screening methods for crew members are as non-invasive as possible. <p>Health monitoring</p> <ul style="list-style-type: none"> Crew members should monitor themselves for fever, cough, shortness of breath, or other symptoms of COVID-19 according to WHO guidance. The WHO cut off point for fever is 38°C or higher.

- Crew members should take their temperature at least twice per day during duty periods and at any time they feel unwell.
- Crew members should stay at home or in their hotel room, notify their employers' occupational health programme, and not report for work if they develop a fever, shortness of breath, or other symptoms of COVID-19. They should not return to work until cleared to do so by the employers' occupational health programme and public health officials.

Examples of crew exposure concerns, include the following:

- Are within a mandated period of quarantine related to previous travel and/or duty.
- A passenger testing positive for Covid-19 regardless of symptoms.
- Know that they have been exposed to a person showing symptoms of COVID-19.
- Are experiencing any symptoms of COVID-19.
- Have recovered from COVID-19 symptoms but have not been assessed by the employers' occupational health program and public health authority.

During Flight:

- If a crew member develops symptoms during flight, the crew member should stop working as soon as practical, put on a medical mask, notify the pilot in charge, and maintain the recommended physical distance from others, when possible to do so. Upon landing, individuals should follow up with airline medical and public health officials.
- Guidelines for managing a passenger developing symptoms during flight are set out in the Cabin Crew module.

Health protection

- To protect the health of crew and others, including co-workers, crew members should:
 - Maintain recommended physical distance from others where possible, when working on the aircraft e.g., while seated on the jump seat(s) during take-off or landing, during ground transportation and while in public places.
 - Wash their hands regularly. If hands are not visibly dirty, the preferred method is using an alcohol-based hand rub for 20–30 seconds using the appropriate technique. When hands are visibly dirty, they should be washed with soap and water for 40–60 seconds using the appropriate technique.
 - Be reminded to, along with frequent hand washing/sanitization, avoid touching their face including while wearing gloves.
 - Wear a face covering or medical mask while around other people, especially in situations where the recommended physical distance from others cannot be maintained.
 - Face coverings, medical masks and gloves should not impact the ability to carry out normal, abnormal and emergency safety procedures, such as the donning of oxygen masks, carrying out firefighting procedures etc.

Note - A face covering should not replace the use of medical masks or other PPE provided in the universal precaution kit (UPK) when interacting with a sick traveller on board an aircraft.

- Inspect the integrity of the UPKs before each flight. Sealed kits need not be opened as it can be assumed that the contents will be as labelled. Crew members should follow existing air carrier policy and procedures regarding the use of PPE in the UPKs if needed to provide care to a sick passenger on board.
- Follow the guidance and precautions of the State and relevant health authorities related to COVID-19.

Additionally, airlines should:

- Provide sufficient quantities of cleaning and disinfectant products (e.g. disinfectant wipes) that are effective against COVID-19 for use during flight.
- Consider providing face coverings or medical masks to crew members for routine use when on duty, if these do not interfere with PPE, while carrying out job tasks and when it is difficult to maintain the recommended physical distance from co-workers or passengers.

Use of lavatories

- Ideally, one or more lavatories should be reserved for crew use, in order to limit the potential for infection from passengers.

Crew rest compartments

- To minimize any possibility of cross infection, pillows, cushions, sheets, blankets or duvets, where provided, should not be used by multiple persons unless coverings are disinfected.
- Some airlines issue each crew member with their own provisions and the cabin crew members are responsible for ensuring that they are removed and bagged after use.
- Other airlines provide bulk loading for crew rest area bedding items. Where this is the case, crew members should install their own bedding items before their rest period and remove them hygienically afterwards.

Training devices

- The frequency of routine cleaning of flight simulators and training devices and other training aids, or equipment used during training (including oxygen masks) should be increased. Cleaning products used should be compatible with COVID-19 disinfectants.

Means for uniform implementation

- Ensure that these considerations are fully supported by:
 - The applicable non-governmental agencies
 - Public health, immigration and customs agencies
 - Civil aviation authorities.

- A high degree of collaboration between airport operators and their associated stakeholder community.
- Associated policy, procedures and training are developed to reinforce the importance of these considerations.
- Use the *Crew COVID-19 Status Card* (PHC Form 1) or a similar one when appropriate.

<i>Element</i> <p style="text-align: center;">Flight Crew</p>
<p><i>Brief description (Objective)</i></p> <p>Provide harmonised health protection and sanitation considerations applicable to Flight Crew which can be implemented globally.</p>
<p><i>Considerations</i></p> <ul style="list-style-type: none"> • Access to the flight deck should be limited to the greatest extent possible. • Flight crew members should only leave the flight deck for short physiological breaks and scheduled rest. • In the case of flight crew at controls displaying symptoms, flight crew should don medical masks and the operator should consider whether removal from the flight deck is an appropriate mitigation within their risk assessment, and refer to established procedures to identify whether a diversion is needed. • Face coverings or medical masks, as defined by the airline, should be worn by flight crew and by others who enter the cockpit. Flight crew may remove their face covering or medical mask when the cockpit door is closed. Face coverings or medical masks should be used whenever they leave the flight deck. • Airlines should ensure that face coverings or medical masks worn by crew, can be removed rapidly so that oxygen masks can be placed unhindered on the face, properly secured, sealed, and supplying oxygen on demand and that crew are provided with the correct guidance on how to do so. When leaving the flight deck, all items should be stowed, personal items removed, and flight deck is ready for cleaning and disinfection. • Prior to each cockpit crew change, the flight deck should have been fully cleaned and disinfected. • In-person interactions with the cabin crew should be reduced to a minimum. • If possible, only one person should be designated to be able to enter cockpit when necessary. • Only one member of the flight crew or technical crew should be allowed to disembark the aircraft to complete the external inspection, refuelling, etc. In such case direct contact with the ground crew should be avoided.
<p><i>Means for uniform implementation</i></p> <ul style="list-style-type: none"> • Ensure that these considerations are fully supported by: <ul style="list-style-type: none"> ○ The applicable non-governmental agencies. ○ Public health, immigration and customs agencies. ○ Civil Aviation Authorities. • A high degree of collaboration between airport operators and their associated stakeholder community. • Associated policy, procedures and training are developed to reinforce the importance of these considerations. • Use the <i>Crew COVID-19 Status Card</i> (PHC Form 1) or a similar one when appropriate.

<p><i>Element</i></p> <p style="text-align: center;">Cabin Crew</p>
<p><i>Brief description (Objective)</i></p> <p>Provide harmonised health protection and sanitation considerations applicable to Cabin Crew which can be implemented globally.</p>
<p><i>Considerations</i></p> <ul style="list-style-type: none"> • Cabin crew who are in contact with a passenger or a colleague suspected of being infected should not visit the flight deck unless it is unavoidable. • Crew members should continue to assist passengers who become ill in-flight. • In the case of someone suspected of having COVID-19, a crew member is to be designated to care for the passenger. That crew member must don the PPE provided in the UPK before engaging in close contact with the ill passenger. The ill passenger should be fitted with a medical mask and provided with appropriate assistance. Separate the ill person from the other passengers by a minimum of 1 metre. Where possible, this should be done by moving other passengers away. Depending on cabin design, 1 metre is usually two seats left empty in all directions. If possible, assign one toilet for use only by the ill passenger. The designated crew member(s) should comply with decontamination procedures established by the operator before resuming other duties. • A passenger who develops symptoms in-flight should be assessed by the local public health authorities after landing and prior to disembarking the aircraft following national protocols. • While limiting the number and frequency of physical flight crew checks, an alternative method of checking on flight crew welfare such as regular interphone calls should be implemented. • The use of PPE should not impact the ability to carry out normal, abnormal and emergency safety procedures, such as the donning of oxygen masks, carrying out firefighting procedures etc. • Safety demonstration equipment should not be shared to the extent feasible to reduce the likelihood of virus transmission. If it must be shared, alternate means of demonstration without the equipment should be considered or the equipment should be thoroughly sanitized between use. • Safety demonstrations should highlight to passengers that face coverings and medical masks should be removed before donning emergency oxygen masks, should they be needed. Note that this could be achieved by an additional announcement after screening of the safety video.
<p><i>Means for uniform implementation</i></p> <ul style="list-style-type: none"> • Ensure that these considerations are fully supported by: <ul style="list-style-type: none"> ○ The applicable non-governmental agencies. ○ Public health, immigration and customs agencies. ○ Civil aviation authorities.

- A high degree of collaboration between airport operators and their associated stakeholder community.
- Associated policy, procedures and training are developed to reinforce the importance of these considerations.
- Use the *Crew COVID-19 Status Card* (PHC Form 1) or a similar one when appropriate.

<p><i>Element</i></p> <p style="text-align: center;">Layover</p>
<p><i>Brief description (Objective)</i></p> <p>Ensure that all crew that need to layover or transit at an outstation are aware of the measures necessary to reduce the risk of transmission of COVID-19.</p> <p>Reference should be made to the ICAO Electronic Bulletin EB 2020/30 or as amended for the most up-to-date guidance.</p>
<p><i>Considerations</i></p> <p>Layover/ transits</p> <p>Crew members who are involved in flights with a layover, should not be medically quarantined or detained for observations while on layover or after returning, unless they were exposed to a known symptomatic passenger or crew member on board or during the layover.</p> <p>If crews need to layover or transit at an outstation, air operators should ensure compliance with relevant public health regulations and policies together with measures identified by a risk assessment conducted by the operator that takes account of specific local conditions.</p> <p>In the absence of a risk assessment, air operators should implement the following:</p> <ul style="list-style-type: none"> • Commute arrangements (between airport and hotel, if needed): The air operator should arrange for the commute between the aircraft and the crew’s individual hotel rooms ensuring hygiene measures are applied and the recommended physical distancing, including within the vehicle, to the extent possible. • At accommodation: <ol style="list-style-type: none"> a) At all times, the crew must comply with relevant public health regulations and policies. b) There should be one crew member per room, which is sanitized prior to occupancy. c) The crew, taking account the above, and insofar as is practicable, should: <ol style="list-style-type: none"> i. Avoid contact with the public and fellow crew members, and remain in the hotel room except to seek medical attention, or for essential activities including exercise, while respecting physical distancing; ii. Not use the common facilities in the hotel; iii. Dine in-room, get take-out or dine seated alone in a restaurant within the hotel, only if room service is not available; iv. Regularly monitor for symptoms including fever; and v. Observe good hand hygiene, respiratory hygiene and physical distancing measures when needed to leave the hotel room only for the reasons specified in (i), (iii) or in emergency situations. • Crew members experiencing symptoms suggestive of COVID-19 during layover or transit should: <ol style="list-style-type: none"> a) Report it to the aircraft operator and seek assistance from a medical doctor for assessment of possible COVID-19. b) Cooperate with the assessment and possible further monitoring for COVID-19 in accordance with the evaluation procedure implemented by the State (e.g. assessment in the hotel room, or an isolation room within the hotel, or alternative location).

- If a crew member has been evaluated and COVID-19 is not suspected in accordance with the above procedures implemented by the State, the air operator may arrange for the crew member to repatriate to base.
- If a crew member is suspected or confirmed as a COVID-19 case by the State and isolation is not needed by the State, such crew member could be medically repatriated by appropriate modes of transport; if there is agreement to repatriate the crew member to home base.

Means for uniform implementation

- Ensure that these considerations are fully supported by:
 - The applicable non-governmental agencies
 - Public health, immigration and customs agencies
 - Civil aviation authorities.
- A high degree of collaboration between airport operators and their associated stakeholder community.
- Associated policy, procedures and training are developed to reinforce the importance of these considerations.
- Use the *Crew COVID-19 Status Card* (PHC Form 1) or a similar one when appropriate.

<i>Module</i>	Cargo
<i>Target audience:</i>	
Airline, freight forwarder, trucker, ground handler (cargo terminal operator).	
<i>Element</i>	Road Feeder to Freight Reception & freight pick up
<i>Brief description (Objective)</i>	
Protect cargo handling staff and truckers during the handover points for physical freight (in warehouse) and documentation (often office).	
<i>Considerations</i>	
<ul style="list-style-type: none"> • Onsite biosafety principles: <ul style="list-style-type: none"> ○ Proximity for document handover should be minimized, floor markings should be indicated and / or appropriate PPE should be worn. ○ Wherever possible, hand washing stations or alcohol-based hand sanitizer should be placed on entry. ○ Surfaces (e.g. handles, kiosks) should be regularly cleaned and disinfected ○ Alcohol-based hand sanitizer should be made available for users of kiosks, etc. ○ Area(s) for donning and doffing of appropriate PPE as needed should be identified. • Physical handover of goods (truck offload): <ul style="list-style-type: none"> ○ Drivers should stay in vehicle cabin until instructed (as per relevant procedures). ○ Physical distance should be kept between driver and facility staff where possible. ○ Close contact of personnel should be limited, appropriate PPE should be worn where appropriate. • Documentation handover (office): <ul style="list-style-type: none"> ○ Digital document systems and data exchange should be implemented wherever possible. ○ Physical distancing of at least 1 metre should be kept between all parties where possible, floor markings indicated or the appropriate PPE worn. ○ Where physical documents need to be signed, each signatory should do so with their own pen. ○ Physical barriers (transparent) should be installed at counters and reception. ○ Alcohol-based hand sanitizer should be made available when entering or exiting common areas. • Material handling equipment (MHE) usage (e.g forklifts, hand carts): <ul style="list-style-type: none"> ○ To avoid cross contamination, MHE should be cleaned and disinfected after use. ○ Employees should be educated and should practice personal hygiene principles. ○ Appropriate PPE should be worn where necessary. 	
<i>Means for uniform implementation</i>	
<ul style="list-style-type: none"> • Wall posters, and handouts, downloadable from carrier and GHA web sites. See Posters in Staff Rest Areas for samples. 	

<p><i>Element</i></p> <p style="text-align: center;">Within Cargo facility (Origin / Destination / Transit)</p>
<p><i>Brief description (Objective)</i></p> <p>Protect Cargo facility (warehouse) staff during business operations such as build-up, breakdown, repositioning and documentation handling.</p>
<p><i>Considerations</i></p> <ul style="list-style-type: none"> • Onsite biosafety principles: <ul style="list-style-type: none"> ○ Physical distance should be kept at all times when operational safety is not compromised. ○ Close proximity for handover minimized (e.g. drop zones) or appropriate PPE should be worn. ○ Ground personnel rotations should take into account the need to avoid cross-infection. ○ Alcohol-based hand sanitizer should be placed on entry into common areas. ○ Regular cleaning and disinfection of surfaces (e.g. handles, mobile devices, kiosks) should be established. ○ Sanitizer should be made available for users of kiosks, shared mobile devices, and other shared devices. • Physical handling goods: <ul style="list-style-type: none"> ○ Physical distance should be kept when operational safety is not compromised; <ul style="list-style-type: none"> – When not possible (e.g. 2 person lift needed for heavy cargo) appropriate PPE should be worn. ○ Appropriate PPE should be worn where necessary. • Material handling equipment (MHE) / ground support equipment (GSE) usage: <ul style="list-style-type: none"> ○ To avoid cross contamination MHE and GSE should be cleaned and disinfected between uses. ○ All employees should be educated and should practice personal hygiene principles. ○ Appropriate PPE should be worn where necessary.
<p><i>Means for uniform implementation</i></p> <ul style="list-style-type: none"> • Posters displayed through cargo facility and staff rest areas.

<p><i>Element</i></p> <p style="text-align: center;">Cargo facility to ramp (Origin / Transit / Destination)</p>
<p><i>Brief description (Objective)</i></p> <p>Protect staff during the Cargo facility handover to/from ramp crews in preparation for aircraft loading and unloading.</p>
<p><i>Considerations</i></p> <ul style="list-style-type: none"> • Onsite biosafety principles <ul style="list-style-type: none"> ○ Physical distance should be kept at all times when operational safety is not compromised or appropriate PPE should be worn. ○ Regular cleaning and disinfection of surfaces (e.g. handles, kiosks) should be established. ○ Alcohol-based hand sanitizer should be made available for users of kiosks, shared mobile devices, etc. ○ Close proximity for handover should be minimized (e.g. drop zones) or appropriate PPE should be worn. ○ Ground personnel rotations should take into account the need to avoid cross team infection. • Physical handover of goods <ul style="list-style-type: none"> ○ Physical distance should be maintained, and cargo drop zones used where possible. ○ Close contact of personnel should be limited, and appropriate PPE should be worn where necessary. • Ground support equipment (GSE) usage <ul style="list-style-type: none"> ○ To avoid cross contamination, GSE should be cleaned and disinfected between users. ○ All employees should be educated and should practice personal hygiene principles. ○ Appropriate PPE should be worn where necessary.
<p><i>Means for uniform implementation</i></p> <ul style="list-style-type: none"> • Posters displayed in staff rest areas.

<i>Element</i> Aircraft Loading / Unloading
<p><i>Brief description (Objective)</i></p> <p>Protect ramp handling staff during the loading and unloading of the aircraft, which is usually performed by multiple crews of 3 to 4 persons depending on the operation.</p> <p>Ensure enhanced public health safety when the number of close contact personnel rises during manual loading of the passenger cabin.</p>
<p><i>Considerations</i></p> <ul style="list-style-type: none"> • Onsite biosafety principles <ul style="list-style-type: none"> ○ Physical distance should be kept at all times when operational safety is not compromised or appropriate PPE should be worn. ○ Alcohol-based hand sanitizer should be placed on entry into common areas. ○ Regular cleaning and disinfection of surfaces (e.g. handles, mobile devices, kiosks) should be established. ○ Alcohol-based hand sanitizer should be made available for users of kiosks, shared mobile devices, etc. ○ Close proximity of staff for loading should be minimized or appropriate PPE should be used particularly for passenger cabin loading. ○ Ground personnel rotations should take into account the need to avoid cross team infection. • Physical Loading of goods <ul style="list-style-type: none"> ○ Physical distance should be kept when operational safety is not compromised (encourage single person operations). ○ Close contact of personnel should be limited, and appropriate PPE should be worn where necessary. ○ For “human chain” loading, appropriate PPE should be used (face coverings or medical masks and gloves) and hygiene principles should be applied between operations. • Material handling equipment (MHE) / ground support equipment (GSE) usage <ul style="list-style-type: none"> ○ To avoid cross contamination, MHE/GSE should be cleaned and disinfected between users. ○ All employees should be educated and should practice personal hygiene principles. ○ Appropriate PPE should be worn where necessary.
<p><i>Means for uniform implementation</i></p> <ul style="list-style-type: none"> • Posters in staff rest areas. • Use the <i>Airport COVID-19 Cleaning / Disinfection Control Sheet</i> (PHC Form 3) or a similar one where appropriate.

3. FORMS AND POSTERS

CREW COVID-19 STATUS CARD									
<p>Purpose of this card: Information to be recorded by crew prior to departure to confirm their COVID-19 health status and to facilitate processing by State’s Public Health Authorities.</p> <p>Notwithstanding completion of this card, a crew member might still be subjected to additional screening by Public Health Authorities as part of a multilayer prevention approach e.g. when recorded temperature is 38 C° (100.4 F°) or greater.</p>									
<p>1. During the past 14 days, have you had close contact (face-to-face contact within 1 meter and for more than 15 minutes or direct physical contact) with someone who had symptoms suggestive of COVID-19?</p> <p style="text-align: right;">Yes <input type="checkbox"/> No <input type="checkbox"/></p>									
<p>2. Have you had any of the following symptoms during the past 14 days:</p> <table style="width: 100%; border: none;"> <tr> <td style="padding: 2px 10px 2px 20px;">Fever</td> <td style="padding: 2px 10px 2px 20px;">Yes <input type="checkbox"/> No <input type="checkbox"/></td> </tr> <tr> <td style="padding: 2px 10px 2px 20px;">Coughing</td> <td style="padding: 2px 10px 2px 20px;">Yes <input type="checkbox"/> No <input type="checkbox"/></td> </tr> <tr> <td style="padding: 2px 10px 2px 20px;">Breathing difficulties</td> <td style="padding: 2px 10px 2px 20px;">Yes <input type="checkbox"/> No <input type="checkbox"/></td> </tr> <tr> <td style="padding: 2px 10px 2px 20px;">Sudden loss of sense of taste or smell</td> <td style="padding: 2px 10px 2px 20px;">Yes <input type="checkbox"/> No <input type="checkbox"/></td> </tr> </table>		Fever	Yes <input type="checkbox"/> No <input type="checkbox"/>	Coughing	Yes <input type="checkbox"/> No <input type="checkbox"/>	Breathing difficulties	Yes <input type="checkbox"/> No <input type="checkbox"/>	Sudden loss of sense of taste or smell	Yes <input type="checkbox"/> No <input type="checkbox"/>

**PUBLIC HEALTH COVID-19 PASSENGER SELF DECLARATION
FORM**

Proposal – a health declaration to include on the reverse of the existing PLF.

PUBLIC HEALTH COVID-19 PASSENGER SELF DECLARATION FORM	
<p>Purpose of this form: This form is intended to support public health authorities by allowing arriving passengers to easily provide relevant information pertaining to their health status, particularly with regard to COVID-19. Information needs to be recorded by an adult member of the group or travel group. Notwithstanding completion of this form, a passenger might still be subjected to additional health screening by the Public Health Authority as part of a multi-layer prevention approach. Your information is intended to be held in accordance with applicable national laws and used only for public health purposes.</p>	
<p>1) Traveller Information:</p> <p>First Name(s): <input type="text"/></p> <p>Last Name(s): <input type="text"/></p> <p>Date of Birth (dd/mm/yyyy): <input type="text"/></p> <p>Travel document No. & issuing country: <input type="text"/> <input type="text"/></p> <p>Country of residence: <input type="text"/></p> <p>Port of Origin: <input type="text"/></p>	
<p>2) During the past 14 days, have you, or a member of your group travelling with you, had close contact (face-to-face contact for more than 15 minutes or direct physical contact) with someone who had symptoms suggestive of COVID-19? Yes <input type="checkbox"/> No <input type="checkbox"/></p>	
<p>3) Have you, or any member of your group travelling with you, had any of the following symptoms during the past 14 days:</p> <p>Fever Yes <input type="checkbox"/> No <input type="checkbox"/> Shortness of breath Yes <input type="checkbox"/> No <input type="checkbox"/> Coughing Yes <input type="checkbox"/> No <input type="checkbox"/> Sudden loss of sense of taste or smell Yes <input type="checkbox"/> No <input type="checkbox"/></p>	
<p>4) Have you, or any member of your group travelling with you, had a positive COVID-19 test in the last 3 days? Yes <input type="checkbox"/> No <input type="checkbox"/> Please attach report if available</p>	
<p>5) Please indicate all countries and cities that you and the group travelling with you have visited or transited through in the last 14 days (including airports and ports), providing the dates of the visit. List the most recent country first.</p> <p>_____</p> <p>_____</p>	
<p align="center"><i>For more information on penalties related to the provision of false information on this form, please refer to the applicable national legislation and/or local health authorities.</i></p>	
<p>Signature:</p> <p>Date:</p>	

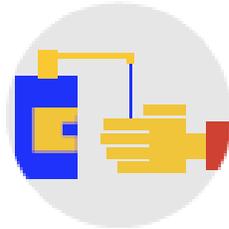

Examples of POSTERS IN STAFF REST AREAS

Instruction for Staff during COVID-19

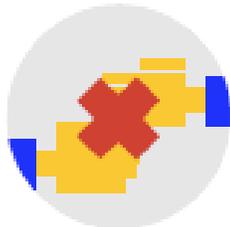

Regularly wash your hands

Use liquid soap and water to wash your hands for at least 20 seconds every time you enter the building.

Disinfect

When handwashing is not possible, disinfect your hands with an alcohol-based hand rub.

Avoid shaking hands

Remember that the virus spreads through coughing and sneezing via airborne droplets, as well as through direct contact.

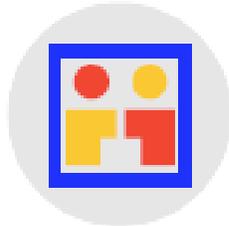

Respect physical distancing

Maintain a safe distance from others by following floor markings or other indicators. Driver to stay in the vehicle until instructed and follow local procedures.

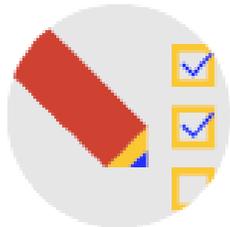

Clean regularly

Disinfect all frequently touched surfaces and all the equipment between uses.

Maintain the distance

Avoid entering enclosed rooms with other people present or wear appropriate personal protective equipment.

Use your own pen

Ensure you don't touch others' pens when signing documentation.

Follow any company, local or national guidance and regulations, especially if you show potential symptoms.

BE RESPONSIBLE.

STAY SAFE.

FACE COVERINGS AND MEDICAL MASKS			
COVERING/MASK	Efficiency at filtering Large Droplets	Efficiency at filtering Aerosols	Use in Aviation
 N95 Mask	99.9%	95%	Not routinely recommended. For use in healthcare and other occupational settings.
 Surgical Mask	98.5%	89.5%	Recommended
 Two-layer Cotton Mask	99.5%	82%	Recommended if 2 or more layers
 Tea Towel or Dishcloth	98%	72.5%	Not Recommended
 100% Cotton T-shirt	97%	51%	Not Recommended
 Silk or Lace	56%	54%	Not Recommended
 Scarf or Bandana	44%	49%	Not Recommended
 Mask with Built-in Valve or Vent	90%	90%	Not allowed due to risk of transmitting the virus

Based on Source: Democritus University of Thrace; Duke University; Journal of Hospital Infection; Public Health England; University of Chicago; University of Illinois at Urbana-Champaign

HOW TO SELECT, WEAR, AND CLEAN YOUR MASK

DO choose masks that:

DO NOT choose masks that:

Have exhalation valves or vents, which allow virus particles to escape

Gaiters & Face Shields

CAUTION: Evaluation is ongoing but effectiveness is unknown at this time

Special Situations: Children

If you are able, find a mask that is made for children

If you can't find a mask made for children, check to be sure the mask fits snugly over the nose and mouth and under the chin

Special Situations: Glasses

If you wear glasses, find a mask that fits closely over your nose or one that has a nose wire to limit fogging

Do NOT put on children younger than 2 years old or the age specified by your national public health authority

DO wear a mask that:

- Covers your nose and mouth and secure it under your chin
- Fits snugly against the sides of your face

For more information, visit our [How to Wear Masks](#) web page.

How NOT to wear a mask:

X Around your neck

X On your forehead

X Under your nose

X Only on your nose

X On your chin

X Dangling from one ear

How to take off a mask:

Carefully, untie the strings behind your head or stretch the ear loops

Handle only by the ear loops or ties

Fold outside corners together

Be careful not to touch your eyes, nose, and mouth when removing and wash hands immediately after removing
